

## Educating with Video

**Abdulrahman Alnasarallah**

### Introduction

With the passage of time, the education system has gone through lot of structure changes. It is important for the people who are imparting education has to ensure that they take into account the underlying changes that have happened as fast as the educational system is concerned. The computers, tablets and other hand held devices that are important in that regard as they allow the educators to impact the education in the right manner. The usage of the technology is also important due to the fact that the educators can make students acquainted with the new technology with the usage of technology.

### Discussion

#### Learning Opportunities :

There are hosts of online opportunities and educational resources at their disposal can increase the productivity of the educational process (Selwyn, 2012). The rate of education can also be accelerated with the help of that. On

the other hand, when students have to be physical present at the classroom, the costs of the education must also be taken into the consideration (Matsutomo et al, 2012).

#### Usage of the Technology in Education in United

#### States :

The good thing is that there are many states in the USA that have taken note of the importance of the technology in the education and thus they have integrated

technology in their education (Selwyn, 2012). Now there are two ways through which the technology can be used for the education. The first way which is conventional is that there must be separate time that must be allocated to the main course, on the other hand, the dual enrollment, the credit recovery and other things must also be taken into the consideration (Selwyn, 2012). At the same time, the program can be structure in the way that both the electives and the subjects can be talked about online.

#### **Using Blended Learning :**

Other method that has become rather popular these days is the blended learning. What it does is that it is a sort of integration that seems to exist between the face to face education and the online learning (Matsutomo et al, 2012). There people though who do not rate online education that highly as the reputation of the online degree's is not increasing at the moment. The strategy can work well if there different learning styles to be incorporated in the studies.

#### **Conclusion:**

At the same time, the generation of today is well versed with the usage of the technology, but the fact remains that are not guided with the usage of the technology and how it can be used for meaningful purpose. This is one thing that the students will learn that instead of using the online technology and internet for something negative, they all can be put into use in the meaningful manner. With the advent of the social media, and the internet, the vocabulary that they have to use is also changing. So it would not be really bad idea of the usage of the technology is integrated into the education for something constructive. These are some of the things that are needed to be looked at.
