

# A STUDY OF FLORAL ELEMENTS OF IGATPURI FOREST OF NASIK DISTRICT (M.S)

Dilip Ahire

Department of Botany, M.S.G.College Malegaon Camp – 423203 (M.S.)

## ABSTRACT

The variation in climate & diversity in the topography of various regions of Nasik have allowed to penetrate the Eastern as well as Western species & endemic flora has been affected abruptly, Which can be seen from the present study. The phytogeographical elements are fundamental elements for understanding flora of any area. It is clear that floristic work is incomplete without any account of floral elements any area . the floral elements occurs in Igatpuri forest. These floral elements are such as Indian, Indo- Malayan, Tropical, Paleotropical, Pantropics, Neotropical, Cosmopolitan, Perso-Arabian & Mediterranean decoresing order & their percentage is also different. Analysis of a flora of Igatpuri forest in such a way indicate status of a forest & such type of analysis is also essential for origin & development of flora.

**Keywords :** Floral elements, Igatpuri forest, Nasik District.

## INTRODUCTION

Forest are the main components of earth hence they act as life supporting system. But since last few decades the biodiversity of these forest disappearing at alarming rate. India with its varied climatic, topographical & edaphic conditions has nearly all types of such habitats where the survival of plant species is possible. Therefore , the vegetation of India is very rich & is an assemblage of floristic elements of various phytogeographical regions. From neighbouring countries several plants entered India & were naturalized in the it's vegetation in remote past. Therefore, it becomes necessary to determine the various floristic elements present in the vegetation of the country.

The study area of igatpuri forest is located in the western Ghats & surround by the highest peaks of Sahyadri i.e. western Ghats. Western ghats is one of the well known world's biodiversity hotspots. The present study sites is within the Western Ghats of India, hence present work is an attempt to known status of vegetation in Igatpuri forest. Hooker (1904) & Champion (1936), working on the flora & vegetation of India, belived that there was no endemic plant in the Indian subcontinent & all the plant species present , have migrated from other countries. Later on several Indian workers like Chatrajee (1939) , Wulf,E.V.(1943), Bharucha & Meher - Homji (1965), Meher- Homji (1970) have studied the vegetation in different parts of India & discarded this imperialistic view of early British workers & concluded that the flora of Indian subcontinent contains a significant perecentage of endemic plants . Various workers Cherian,P.J. & Pataskar, R.D.(1971), Menon , A.R.R.& Shah, G.L.(1982), Yadhav , S.S.& Mathew, V.(1994) Joshi et al,(2004), Asish Kumar,Marcot,B.C. &

Ajai Saxena (2006) & Mishra, V.K.& Sharma A.C.(1910),have studied floristic elements, phytogeography & endemic plants in the vegetation of different parts of India , but Igatpuri forest of nasik district , which rich in its floristic elements ,has not been explored so far.Therefore, the present investigation has been taken.

#### MATERIAL AND METHOD:

The Igatpuri forest is vegetationally very rich.It lies between 20N latitude & 74 E longitude of 599 mm above main sea level. The Igatpuri is extreme south- west & bounded on the north by part of Nasik ,on east by Jalgaon & Auragabad & on south by Ahmadnagar & west by Thane district. The climate is cool through out the year. The soil type is black & red .Vaitarna & Darana are two main rivers. The average rainfall is 10345 mm. The temperature range from 18°C to 46°C. During the rainy seasons the entire area shows green cover due to plant growth. Ecological conditions favour the growth of many herbs,shrubs, climbers & number of trees are significant for biological diversity.

**Field work :** For the vegetation studied eleven areas localities were selected randomly throughout forest. Quadrates of 10 x 10 meters were laid down in different direction in each places in different forest. Altogether 11 plots were laid down for trees & shrubs in the entire area studied. Thus the sampling was done for the total area of 1100 square meter in the forest.

**Laboratory work:** The study of plant diversity of Igatpuri forest was undertaken during the course (2005 to 2010).All plants are arranged according to Bentham & Hooker's system of classification .The plants were collected in different seasons & identified with the help of floras (Hooker, 1872- 1897),(Cooke,1967), (Almeida,S.M.,1990) (Lakshminarashimhan P.1990),(Naik, V.N.1998),

#### Discussion :

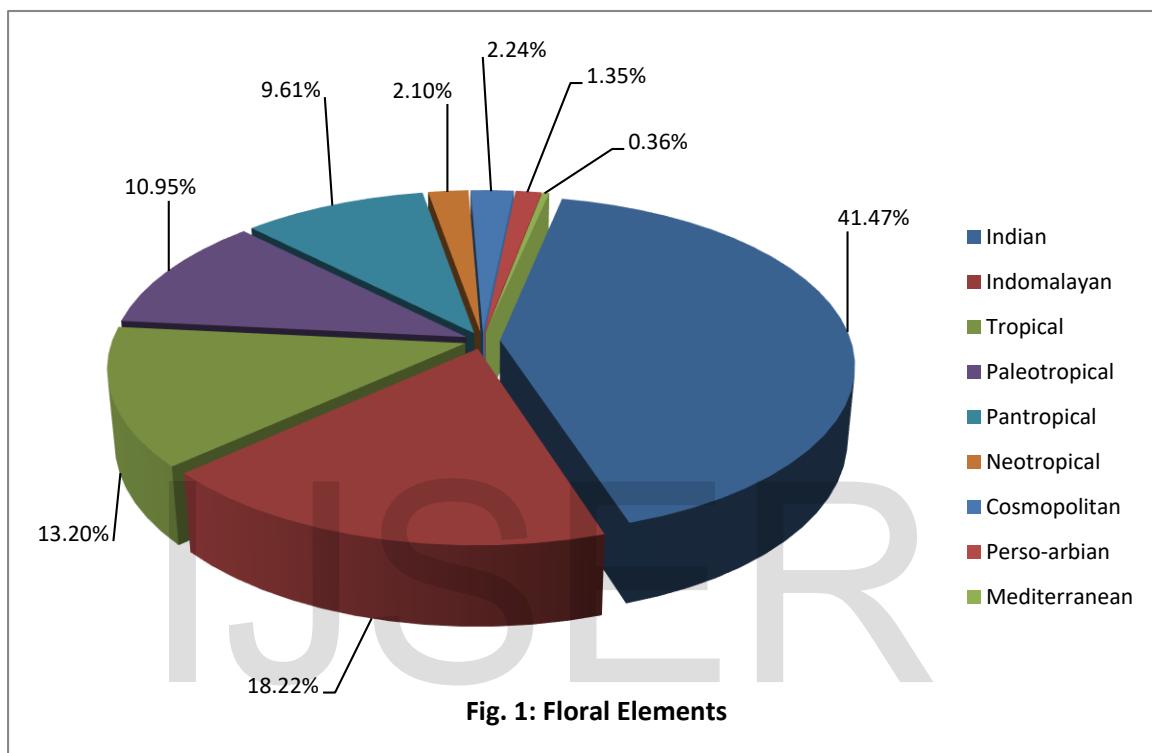

The number & Percentage of species in different floral elements is presented in table 1.

The Indian elements constitutes the largest number (41.47%) followed by Indomalayan elements (18.22%), Tropical elements (13.20%), Palaectropical elements (10.95%), Pantropical (9.61%), Neotropical (2.60%), Cosmopolitan (2.24%), Perso-arabian (1.35%) and Mediterranean elements relatively very few (0.36%).

**Table 1: Number and Percentage of floral elements of Igatpuri.**

| Sr. No. | Floral elements | Number | Percentage |
|---------|-----------------|--------|------------|
| 1       | Indian          | 462    | 41.47      |
| 2       | Indomalayan     | 203    | 18.22      |
| 3       | Tropical        | 147    | 13.20      |
| 4       | Paleotropical   | 122    | 10.95%     |
| 5       | Pantropical     | 107    | 9.61%      |
| 6       | Neotropical     | 29     | 2.10%      |
| 7       | Cosmopolitan    | 25     | 2.24%      |
| 8       | Perso-arbian    | 15     | 1.35       |

|   |               |             |            |
|---|---------------|-------------|------------|
| 9 | Mediterranean | 04          | 0.36%      |
|   | <b>Total</b>  | <b>1114</b> | <b>100</b> |
