# One-pot Palladium-Catalyzed Synthesis And Antifungal Properties of Polycarbo- substituted Furo[3,2-c]quinolines 

Felix Adetunji Oyeyiola, Olutola Bob Soile, Moses Olayemi Akiibinu

#### Abstract

A series of $2,6,8$-triarylquinolin-4(1H)-ones were functionalized when treated with molecular iodine in the presence of sodium carbonate in tetrahydrofuran to afford the requisite $2,6,8$-triaryl-3-iodoquinolin-4(1H)-ones. The latter were then subjected to two-step Sonogashira cross-coupling and tandem heteroannulation reaction with terminal alkynes in the presence of $\mathrm{Pd}(0)-\mathrm{Cul}$ with triethylamine as a base in DMF-H2O mixture to afford exclusively the 2 -substituted 4,6,8-triarylfuro[3,2-c]quinolines in a one-pot operation. The prepared polycarbosubstituted furoquinolines were subjected to preliminary screening for antimicrobial susceptibility. All the new compounds were characterized using a combination of 1H NMR, 13C NMR and IR spectroscopic and mass spectrometry techniques.

Keywords: Cross-coupling, Palladium-catalyzed, Sonogashira, Suzuki-Miyaura,Spectrscopy, 2,6,8-triarylquinolin-4(1H)-ones, 4,6,8-triarylfuro[3,2c]quinolines, mass spectrometry

### 1.0 Introduction

Annulated quinolines such as furoquinoline derivatives are of special interest due to a variety of physiological properties they possess, these include antiplasmodial, antifungal and antibacterial activity.[1],[2],[3],[4] These azoloquinoline derivatives are characterized by a five-membered heterocyclic furan ring with a single heteroatom fused to the main quinoline framework.[5],[6] They can either be linear or angular depending on the site of the main quinoline framework on which the furan ring is attached. Furoquinolines abound in nature and their synthesis continue to receive attention among organic chemists.[7],[8] Kolbisine and ptelatine are members of the naturally occurring furoquinolines,[9] a class of antimicrobially active alkaloids;[10] along with skimmianine, kokusaginine and maculine are present in a large number of rutaceous plants like Galipea and Esenbeckia.[9],[10] Kolbisine has been found to exhibit antifungal and antibacterial activities against both Candida albicans and Salmonella typhi,
respectively.[2],[9] Kokusagnine, on the other hand, was found to exhibit antiplasmodial activity against Plasmodium falciparum in vitro.[1],[9] The mechanism of antimicrobial activity of furoquinolines is connected to their ability to bind DNA forming hydrogen bond using the oxygen atom in the furan ring.[11] In recent times, both linear and angular furoquinolines have exhibited promising immunosuppressive activity,[12] while the angular derivatives serves as anticancer agents.[13] The angular 4-anilinofuro[3,2-c]quinoline derivatives exhibited potent cytotoxicity against a full panel of NCI's 60 cancer cell lines.[13] They have therefore received much attention in a quest to efficiently develop more important furoquinolines. Many of the conventional synthetic methods employ tedious and low yielding ring upon ring approach and do not also allow for introduction of diverse substituents.[14],[15] Concerted efforts has been devoted to linear furoquinolines,[16],[17] there is scarcity of literature reports on the angular furoquinolines.[18]

Among the methods developed to date for the synthesis of furoquinolines is the Lewis acid catalyzed imino Diels- Alder reaction between $N$-benzylideanilines and nucleophilic olefins to yield a mixture of endo and exo furo[3,2-c]quinolines.[19]

Furthermore, angular furoquinolines were also previously prepared by cycloaddition through a 3-component reaction involving cyclohexanecarbaldehyde, methyl 3-(2aminophenyl)propionate and ethyl $\alpha$-( $p$-nitrophenyl)- $\alpha$-isocyanate in methanol at room temperature then reflux in toluene to obtain 2-alkoxyfuro[2,3-c]quinoline.[20] Moreover, a 4-step oxidative cyclization of substituted 4-hydroxy-3-(methylbut-2-enyl)quinolin-2-ones with $m$-chloroperbenzoic acid to afford 8substituted 2-(1-methylethyl)-5-methyl-4,5-dihydrofuro[3,2-c]quinolin-4-ones has also been reported.[9] Aza-Diels-Alder reaction of benzaldehyde derivatives with arylamines and 2,3dihydrofuran in the presence of nano silica chromic acid as a catalyst afforded a mixture of disubstituted tetrahydrofuroquinolines cis and trans isomers in good yields.[21] Other approach to polysubstituted annulated quinolines bearing aryl substituents involves the use of halogenoquinolinones as substrates for metal catalyzed cross-couplings to incorporate the carbon-bearing substituents on the heterocyclic framework and in situ heteroannulation.[22],[23]

### 2.0 RESULTS AND DISCUSSION

Our 2-step approach to the polycabosubstituted furoquinolines involves the use of the known 2,6,8-triarylquinolin-4( $1 H$ )-ones 1a-h.[24] To initiate our studies, we first prepared a series of $2,6,8$-triaryl-3-iodoquinolin- $4(1 H)$-ones $\mathbf{2 a}$-h as sole products in good yields through iodination of the corresponding NH-4-oxo derivatives when treated with molecular iodine in the presence of sodium carbonate in tetrahydrofuran at room temperature (Scheme 1). The ${ }^{1} \mathrm{H}$ NMR spectra of compounds 2a-h reveals the absence of the signal for the singlet attributed to the olefinic proton displaced by the iodine at $\delta c a .6 .70 \mathrm{ppm}$. The corresponding ${ }^{13} \mathrm{C}$ NMR spectra show resonance for $\mathrm{C}-3$ and $\mathrm{C}=\mathrm{O}$ at $\delta$ ca.86.8 and 174.9 ppm , respectively. The IR spectra reveal absorption bands at $v_{\max } c a .3394$ and $1644 \mathrm{~cm}^{-1}$ for NH and $\mathrm{C}=\mathrm{O}$, respectively. The accurately calculated $m / z$ value with M+2 peak typical of ${ }^{127}$ I isotope also confirmed the presence of iodine in the compounds.

Scheme 1: Halogenation of 2,6,8-triarylquinolin-4(1H)-ones 1a-h
With compounds $\mathbf{2 a - h}$ in hand, we next explore these as substrates for palladium-catalyzed Sonogashira cross-coupling and tandem cyclization with terminal alkynes as coupling partners. We first reacted compound 2a with phenylacetylene (1 equiv.) in the presence of $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ or $10 \% \mathrm{Pd} / \mathrm{C}$ as $\operatorname{Pd}(0)$ sources and triethylamine as a base in DMF under reflux as a reference starting point for exploration of the coupling reactions based on literature precedents.[25],[26] In both cases the reaction led to the formation of an inseparable mixture of products. We opted for the use of a $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ as $\mathrm{Pd}(0)$ sources with copper iodide because copper is known to play a role in the transmetalation step with palladium and, in turn, promote intramolecular cyclization step in the catalytic cycle.[27] We then reacted 2a with phenylacetylene ( 1 equiv.) and isolated the starting material and a product characterized using a combination of spectroscopic techniques as compound 3a in (ca.50\%) yield. Increasing the phenylacetylene to 1.5 equiv. afforded compound 3a in $77 \%$ yield. These reaction conditions were extended to other derivatives of 2 using phenyl acetylene and 3-butyn-2-ol as coupling partners to afford the corresponding products $\mathbf{3 b - h}$ in good yields (Scheme 2). The ${ }^{1} \mathrm{H}$ NMR spectra of the annulated compounds 3a-h show the absence of signals corresponding to the NH and all the proton signals were observed in the aromatic region at $\delta c a .7 .06-8.55 \mathrm{ppm}$. The absence of resonance corresponding to the $\mathrm{C}=\mathrm{O}$ in the ${ }^{13} \mathrm{C}$ NMR spectra also confirms the assigned structure. The IR spectra lacks the absorption bands at $v_{\text {max }} c a .3394$ and $1644 \mathrm{~cm}^{-1}$ for NH and $\mathrm{C}=\mathrm{O}$, respectively. The accurately calculated $\mathrm{m} / \mathrm{z}$ values show the absence of the $\mathrm{M}+2$ peak present in the precursors.

### 3.0 Antimicrobial Screening

The antimicrobial screening of several of the synthesized compounds was undertaken, using the minimum inhibitory concentration (MIC) screening assay against six reference pathogens: Staphylococcus aureus (ATCC 25923, Grampositive), Enterococcus faecalis (ATCC 29212, Gram-positive), Escherichia coli (ATCC 8739, Gram-negative), Pseudomonas aureginosa (ATCC 27858, Gram-negative), Candida albicans (ATCC 10231, yeast) and Cryptococcus neoformans (ATCC 14116, yeast) as described in Table 1.

The minimum inhibitory concentrations were determined using the INT micro well method.[28] The synthesized compounds were diluted in acetone so that starting concentrations of 5.00 $\mathrm{mg} / \mathrm{mL}$ were introduced into the first well of a microtitre plate. The starting concentrations were diluted two-fold in each successive serial dilution. Where necessary, further dilutions were performed so that valid endpoint MIC values could be determined. Positive antimicrobial controls, ciprofloxacin for bacteria at starting stock concentrations of $10.00 \mu \mathrm{~g} / \mathrm{mL}$ and amphotericin B for the yeasts at a starting concentration of 100 $\mu \mathrm{g} / \mathrm{mL}$ were included in each assay to confirm antimicrobial susceptibility. Negative controls of acetone were included to evaluate the effect of the solvent on the growth of test microorganisms. A broth control (media incubated without test organism) was included to confirm sterility. Cultures were streaked out onto Tryptone Soya agar to confirm purity. Bacterial cultures were grown overnight at $37^{\circ} \mathrm{C}$, diluted 1:100 and $100 \mu \mathrm{~L}$ inoculated into all wells at approximate inoculum concentrations of $1 \times 10^{6}$ colony forming units $/ \mathrm{mL}$. Incubation followed for 24 hours for bacterial and $37{ }^{\circ} \mathrm{C}$ for 48 hours for the yeasts. After incubation, a $0.40 \mathrm{mg} / \mathrm{mL} p$-iodonitrotetrazolium violet solution was transferred into all inoculated wells $(40 \mu \mathrm{~L})$ and examined to determine a colour change in relation to concentration of
microbial growth. Tests were performed at least in duplicate and in triplicate where results varied by more than one dilution factor.

Table 1: Antimicrobial Evaluation

Compounds $3 \mathrm{e}-\mathrm{i}$ were found to exhibit inhibitory activity against both Candida albicans and Candida neoformans (a fungal causative agent).[29],[30] The highest inhibitory effect against Candida neoformans was recorded by Compounds 3e, 3f, 3g, 3h and $3 \mathbf{i}$ with a MIC of $0.78 \mathrm{mg} / \mathrm{mL}$, while compound $\mathbf{3 i}$ exhibited inhibition against Candida albicans with a MIC of $0.78 \mathrm{mg} / \mathrm{mL}$.

In summary, hitherto unexplored series of polycarbosubstituted furo[3,2-c]quinolines were synthesized and were found to exhibit potential antifungal activities. It was widely believed the fluoro and oxo-substituents were necessary for the antimicrobial activity of the fluoroquinolones.[31],[32] The observed antifungal activity might be as a result of the quinolin- $4(1 H)$-one moiety, the furan ring, the fluorine atom or the fluorophenyl substituents or a combination of all.

### 4.0 Experimental

Commercially available solvents and reagents were used as supplied or purified by conventional methods before use. Melting points were determined on a Stuart melting point apparatus and are uncorrected. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were obtained using a Varian Mercury 300 MHz Spectrometer at the University of South Africa and as $\mathrm{CDCl}_{3}$ or DMSO- $d_{6}$ solution. The chemical shifts were referenced relative to the solvent peaks ( $\delta_{\mathrm{H}}$ 7.25 or $\delta_{\mathrm{C}} 77.0 \mathrm{ppm}$ for $\mathrm{CDCl}_{3}$ and $\delta_{\mathrm{H}} 2.50$ or $\delta_{\mathrm{C}} 40.0 \mathrm{ppm}$ for DMSO- $d_{6}$ ) and are expressed in parts per million (ppm). The IR spectra were recorded as powders on a Digilab FTS 7000 series Win-Pro Fourier Transform Infrared Spectrometer equipped with a nitrogen cooled germanium crystal detector. Merck silica gel 60 $\mathrm{F}_{254}$ plates were used for thin layer chromatography (tlc) and the powder for column chromatography. High and low resolution mass spectra were recorded on a Waters API Q-TOF Ultima mass spectrometer at the University of Stellenbosch. Antimicrobial efficacy evaluation was done at the Department of Pharmacy and Pharmacology, Faculty of Health Sciences, University of Witwatersrand, South Africa. The synthesis and characterization of substrate 1 have been described elsewhere.[24]

### 4.1 Typical procedure for the synthesis of 2,6,8-triaryl-3-iodoquinolin-4(1H)-ones 2a-h

### 4.1.1. 2,6,8-Triphenyl-3-iodoquinolin-4(1H)-one (2a)

A mixture of $1 \mathbf{a}(0.50 \mathrm{~g}, 1.3 \mathrm{mmol}), \mathrm{I}_{2}(0.68 \mathrm{~g}, 2.7 \mathrm{mmol})$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}(0.21 \mathrm{~g}, 2.0 \mathrm{mmol})$ in THF $(20 \mathrm{~mL})$ was stirred at room temperature for 18 hours. The mixture was quenched with saturated sodium thiosulphate solution and the precipitate was collected by filtration and washed with ice-cold water. The crude product was recrystallized in ethanol to afford 2 a as light brown solid, ( $0.48 \mathrm{~g}, 81 \%$ ); mp 219-220 ${ }^{\circ} \mathrm{C}(\mathrm{EtOH}) ; \delta_{H}(300 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ): 7.39 (d, $\left.J 7.5 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.44-7.57(\mathrm{~m}, 11 \mathrm{H}), 7.72(\mathrm{~d}, J 7.5$ Hz, 2H), 7.84 (d, J $2.1 \mathrm{~Hz}, 1 \mathrm{H}), 8.45$ (s, 1H), 8.70 (d, J 2.1 Hz , $1 \mathrm{H}) ; \delta_{C}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 86.4,121.8,124.4,127.2,127.8$, $128.5,128.9,129.0,129.0,129.1,129.8,130.5,131.0,132.1$, 135.1, 136.0, 137.5 (C-1"'), 137.9 (C-1"), 139.5 (C-8), 151.3 (C2), 175.2; IR (neat): $v_{\max }$ (ATR) 3395, 3057, 1736, 1557, 1476, 892, 761, $654 \mathrm{~cm}^{-1} ; m / z: 500(100, \mathrm{M}+\mathrm{H})$; HRMS (ES): $\mathrm{MH}^{+}$; found $500.0411 \mathrm{C}_{27} \mathrm{H}_{19} \mathrm{INO}^{+}$: requires 518.0339

4.2 Typical procedure for the synthesis of 2-substituted 4,6,8-
triaryl-furo[3,2-c]quinoline derivatives 3a-i

### 4.2.1. 2,4,6,8-Tetraphenyl-furo[3,2-c]quinoline 3a

A mixture of 2a $(0.30 \mathrm{~g}, 0.6 \mathrm{mmol}), \mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(0.02 \mathrm{~g}, 0.03$ $\mathrm{mmol}), \mathrm{CuI}(0.011 \mathrm{~g}, 0.06 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(0.34 \mathrm{~mL}, 2.4 \mathrm{mmol})$ in DMF ( 20 mL ) in a three-necked round bottomed flask equipped with magnetic stirrer bar, condenser and rubber septum was stirred under argon for 1 hour. To this mixture was added phenyl acetylene $(0.13 \mathrm{~mL}, 1.2 \mathrm{mmol})$ slowly via a syringe and the mixture was stirred at $100{ }^{\circ} \mathrm{C}$ for 2 hours under argon atmosphere. The mixture was cooled to room temperature and diluted with cold water $(50 \mathrm{~mL})$ and the product was taken up into $\mathrm{CHCl}_{3}(3 \times 50 \mathrm{~mL})$. The combined organic layers were washed with water ( $2 \times 20 \mathrm{~mL}$ ), dried over anhydrous $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. The crude product was purified by column chromatography on silica gel to afford 3a as pale yellow solid, ( $0.23 \mathrm{~g}, 77 \%$ ); mp 202-204 ${ }^{\circ} \mathrm{C}$; $\mathrm{R}_{f}(10 \%$ ethyl acetate/ hexane) $0.72 ; \delta_{H}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): 7.39-7.60(\mathrm{~m}, 12 \mathrm{H})$, 7.87 (d, $J 8.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.94(\mathrm{~d}, J 8.7 \mathrm{~Hz}, 2 \mathrm{H}), 8.00(\mathrm{~d}, J 8.7 \mathrm{~Hz}$, $2 \mathrm{H}), 8.02$ (d, $J 2.1 \mathrm{~Hz}, 1 \mathrm{H}), 8.15$ (d, J $8.7 \mathrm{~Hz}, 2 \mathrm{H}), 8.58$ (d, J 2.1 $\mathrm{Hz}, 1 \mathrm{H}) ; \delta_{C}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): 101.6,117.0,120.0,125.0,127.3$, $127.5,127.7,127.8,128.7,128.9,128.9,129.0,129.1,129.2$, $129.5,129.9,131.1,139.0,139.7,139.8,139.8,140.6,141.5$, $142.3,152.1,156.4,156.8 ; v_{\max }(\mathrm{ATR}) 3069,3032,1590,1482$, $1365,1010,943,874,835,791,737,690 \mathrm{~cm}^{-1} ; \mathrm{m} / z: 474$ (100, $\mathrm{M}+\mathrm{H}$ ); HRMS (ES): $\mathrm{MH}^{+}$, found: $474.1859 \mathrm{C}_{35} \mathrm{H}_{24} \mathrm{NO}^{+}$: requires, 474.1858.
