INDEX- introduction, theory, types, ideal human state, characteristics, working, conclusion

1.INTRODUCTION

Hello my name is Iliyan Manasia. The following pages you will be reading is about the theory of positive energy and negative energy. It is my point of view that this energy which not visual surely exists .It is a fact that our world has experienced some quiet miraculous event about people recovering with the least expectations through maybe willpower, self motivation and the desire to live .

Although the theory about positive energy is strongly opposed in this scientific world there is a possibility that this energy posses incredible power. Power such as to kill bacteria, viruses and the power to rejuvenate our self or any specific part of the body of the body to work efficiently .in the paper we will talk about the characteristics of the particle which helps negative energy to positive energy or vice-versa .the division of different types of charges and their region where they are produced.

In this we are going to talk about how this particles can be used to cure covid-19.this can also be a huge boost in the medical world and maybe mental world. This paper will help to detect which of us are unaware that we are the carrier of this energy.

There have been cases in which a person whose will power is strong and has motivation is to live.

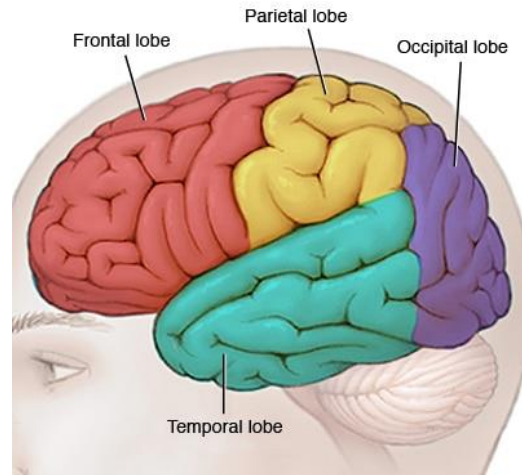

On the other hand that there are cases where a person that can be cured or his case can be improved, if the person who does not want to live or has lost the motivation to live ,die or their case gets bitter and bitter.

You will get to know that there are some ways that people surrounding you are also involved in the charge transfer or transferring energy .you can also control this energy up to certain extent by maintaining a specific decorum.

2.Theory

- A normal person posses 99 particles which cannot be seen which arise from the cerebral part of the brain.
- These particles are always in form group of three particles with their respective charges on them
- The first particle arises from the frontal lobe of the brain; the second particle arises from the parietal lobe of the brain the last particle arises from occipital lobe.

- The frontal lobe deals with emotions and the particle arising from there does the same.
- The parietal lobe deals with senses and the particle arising from the same
- The occipital lobe deals with hearing and vision and the particles arising from there do the same
- The last part of cerebrum is the temporary lobe which is not included in 99 particles, but this part of the brain also produces a particle.
- This particle is an important part of the whole charge changing process.
- In this process negative energy is easy to generate then positive energy

3.Types

There are few types of groups:

- Constant Positive group- 5 groups

These groups have all three particles positive

- DNA related group- 1 group

In this only the centre particle changes its charge.

- Negative groups-5 groups

In this group there are two negative particle

- Neutral groups -11 groups

in this group there are two positive particles.

- Neutral groups(slightly positive)-

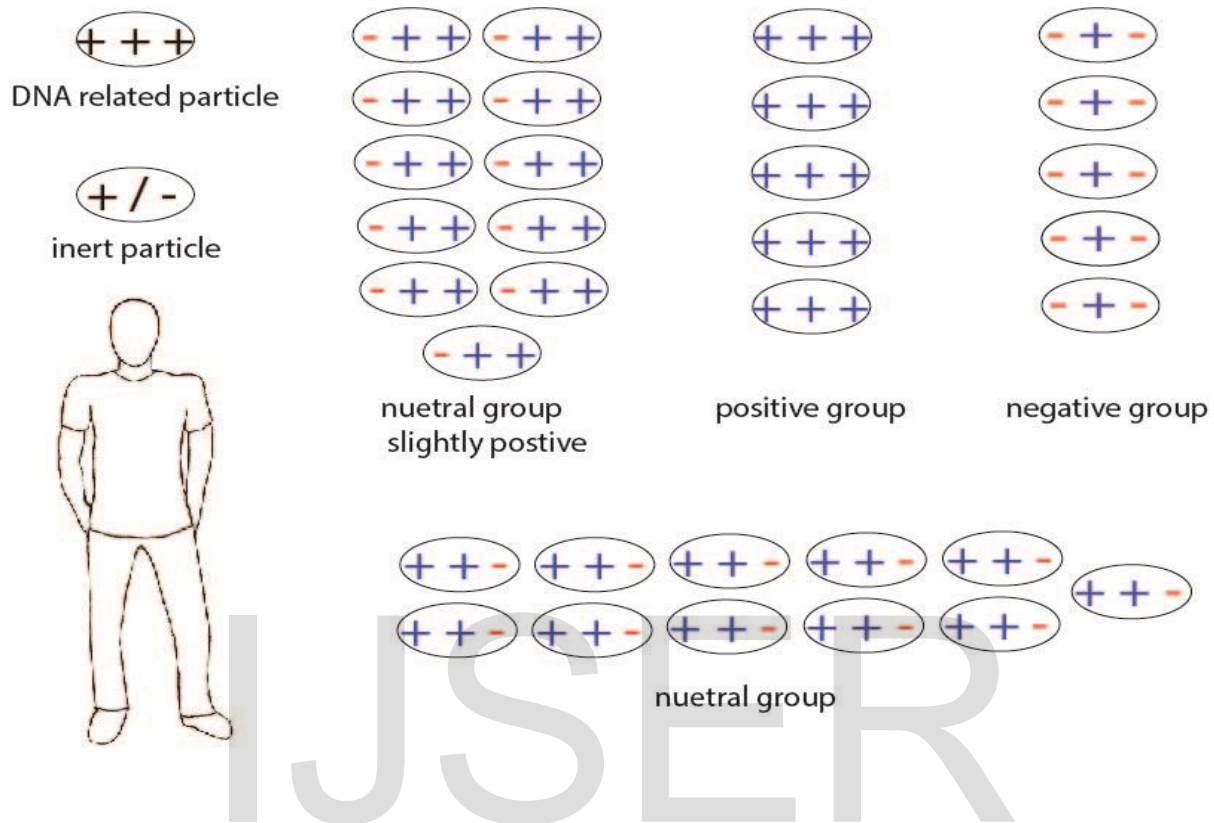

11 these also have two positive electron

- Inert particle-1 particle this particle produces no charge except in the surrounding or DNA related group

4. Ideal human state

5.Characteristics

There are certain attributes and characteristics of all the groups in the way they perform exchange of charges:-

5. 1.Positive groups

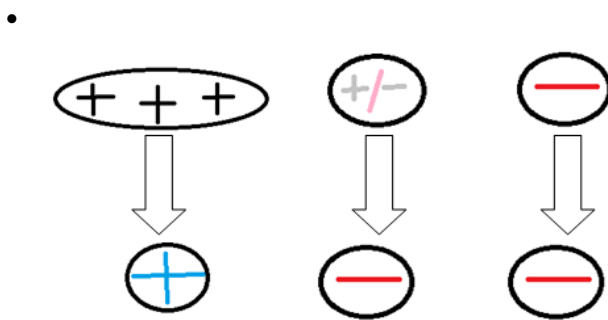

- These group of particles do not react with any other particle, they are always the same.
- These groups are five in number
- These groups cannot be decreased but can be increased
- These groups are the last one to react or the stage which is nearly impossible.
- The creation of this group is extremely difficult, but not impossible the group can be created when you receive positive

charge from the the surroundings , the system and from the DNA related group.

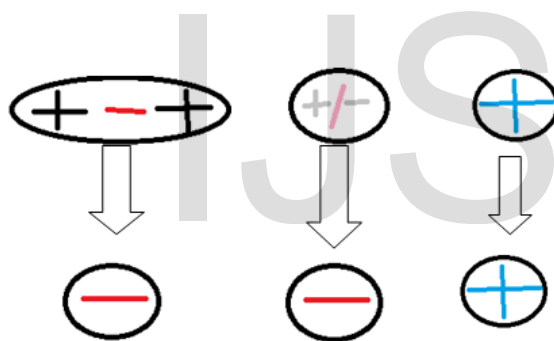

5.2.DNA related group:-

- In this group only one particle changes its charge.
- This particle in middle is the one who chnganges its charge.
- This group reacts with the person of the same DNA and takes its state of charge
- The particle that changes its charge come from the pareital lobe of the brain.
- The charge of the central particle affects the inert particle and the inert particle takes over the charge of that particle in group
- But there are some exceptions,if the person has a DNA group with positive

charge and if the surrounding is having a negative charge then the inert particle will take on the negative charge.

- When the DNA group has the negative charge and the surroundings have a positive charge the inert particles takes on the negative charge.

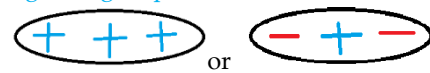

5.3. Inert particle:

- The particle is the most important part of the system.
- This particle is most vulnerable part of the system
- This part changes its charge with surroundings, the DNA group (only if it is negative) and the status of the system .
- The charge can also be acquired on the basis of any past memory with that

particular person or even your emotional attachment with that person, this can also be an object.

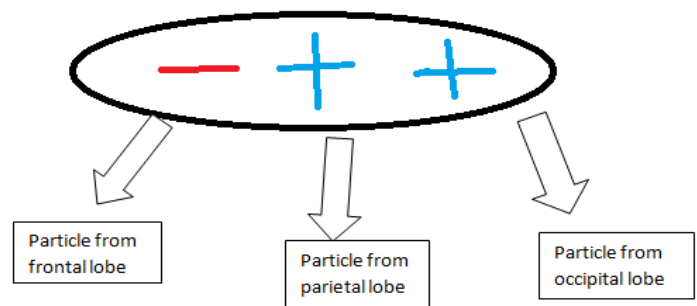

- The object can only affect the system if they have a past memory with that object or some emotional attachment.
- This particle is from the temporary lobe of the brain that is why the charge. That is why the charge fades when the body rejuvenates .
- They do not have any effect on **positive or negative groups.**

- This particle will remain inert if there is no charge from the surroundings and the DNA particle is positively charged.
- This particle on receiving charge from the surrounding or from DNA group , starts the change of charges in system and the groups in the system.
- This particle exhibits negative charge when there is negative charge from the surroundings.

5.4. Neutral groups:

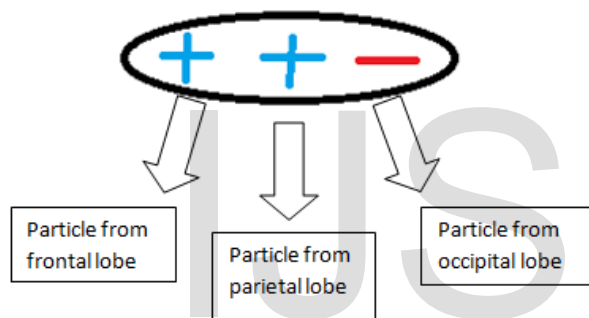

- These groups are in neutral state.
- They have a negative charge on particle arising from frontal lobe of the brain (which handles emotions), positive charge on the particle arising from parietal lobe of the brain and positive charge of the particle arising from the occipital lobe of the brain.

- This group is the only group that can be converted into negative group .
- There is change in the number of groups in every process.
- On receiving negative stimulus from the system it increases in number,when receiving positive stimulus from the surrounding they decrease in number.
- If there is a negative charge in inert particle there is increase in number and slight positive groups decrease and vice-versa.

5.5. Slightly positive neutral group:-

- These groups are 11 in number.

These groups have two positive particle and one negative particle. The first particle that arises from the frontal lobe of the brain,the second parricle arises from the parietal lobe of the brain and these both particle are positive and the particle arising from the occipital lobe is negative.

-
- This is the group that plays the second part of the system on receiving the charge in the inert particle the particle makes the groups active if the charge recived in the

particle is positive there is increase in the number of these groups and decreases the neutral groups. When there is a negative charge in the inert particle it happens vice-versa .

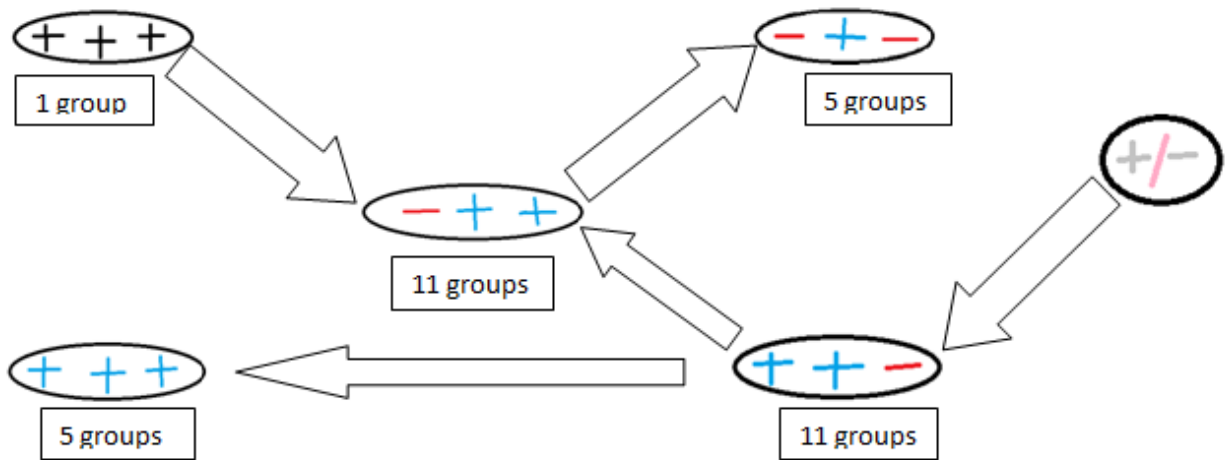

- These groups do not affect the inert particle upto certain a certain concentration

6.Working of the system

PRINCIPLES:

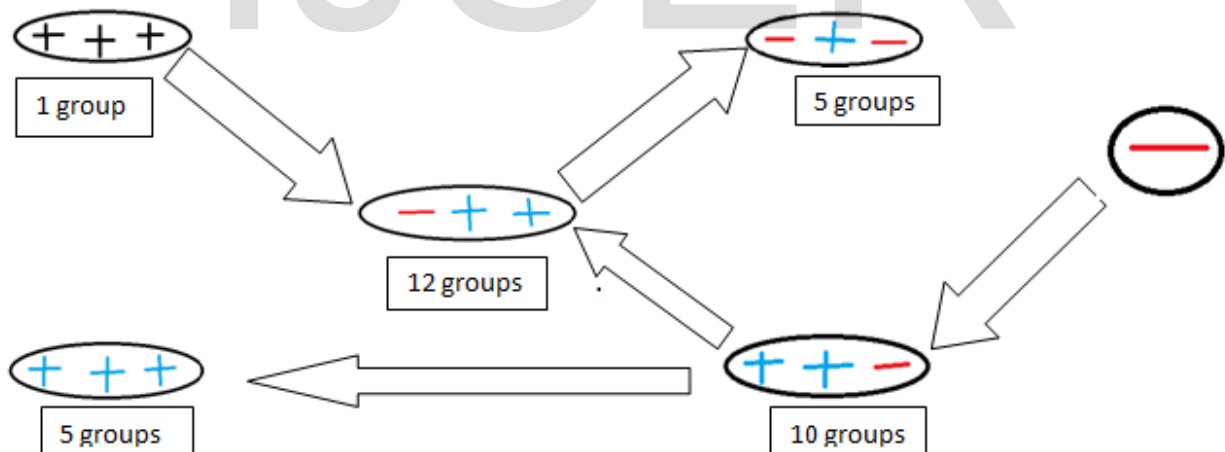

- The number of groups never change .
- They change their type but the sum of all these groups remain the same.
- When more than or equal three negative groups increase the person becomes a negative charge carrier.
- If the person recives positive charge from surrounding ,from the DNA group and from the system only then the positive group will be formed .
- When a person sleeps the system is back to its normal state then next day.

6.1.WORKING(NORMAL STATE):

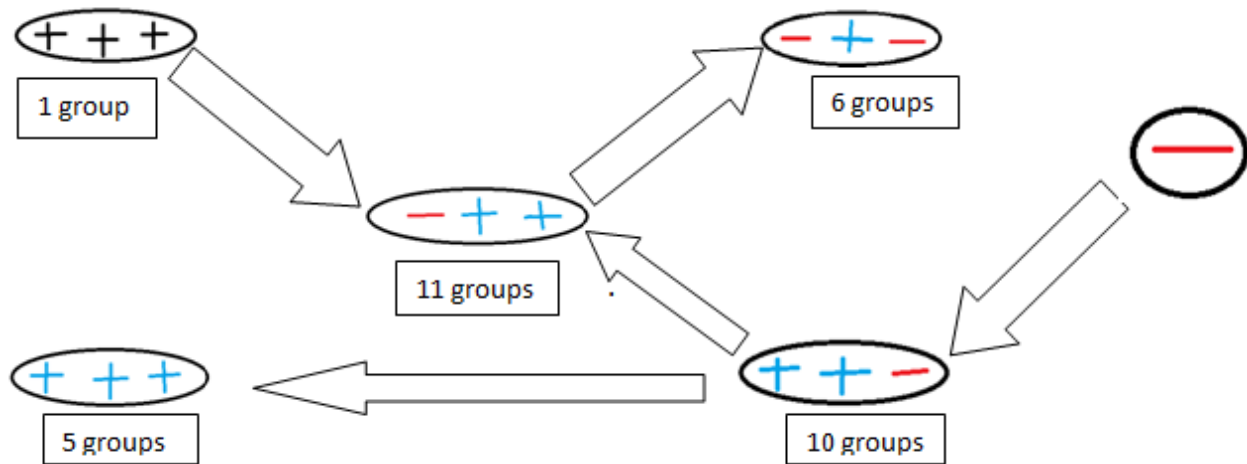

plz refer above to know more about these particles

6.2.ON RECEIVING NEGATIVE CHARGE:

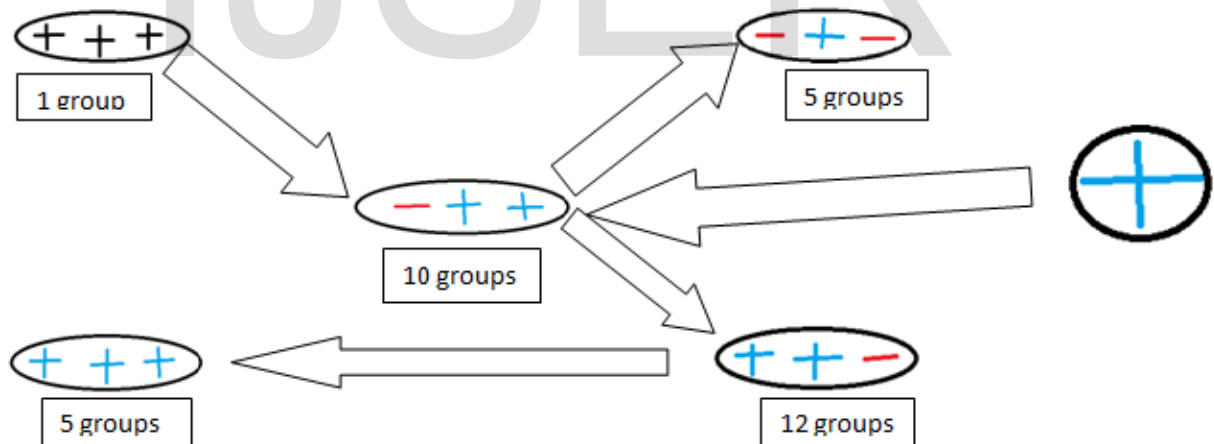

- On receiving the negative charge from the inert particle the one slightly positive neutral group gets converted into neutral group. All other groups remain same only the charge in inert particle goes and the particle becomes inert.

Next step:

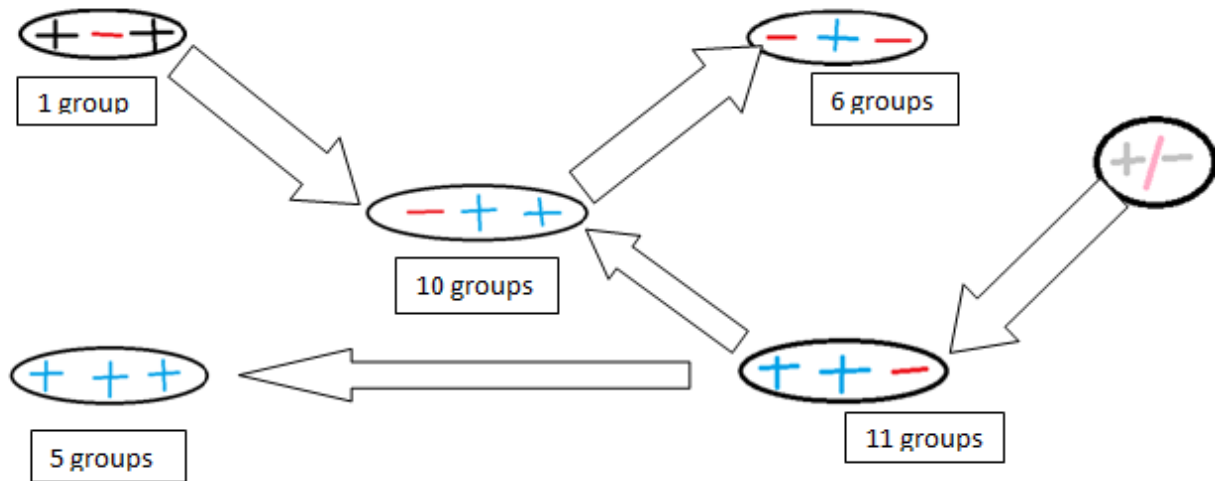

- If the negative charge is emotionally related or the person from whom you are receiving the charge is one who you dislike or have negative feelings against that person, then the neutral group converts into a negative group. If the person develops more or equal to three groups, then the person becomes a negative charge carrier.

6.3. ON RECEIVING POSITIVE CHARGE:

- On receiving the positive energy the neutral group gets converted to slightly positive neutral group. All particles maintain the same number, only the inert particle becomes inert.

6.4.WHEN DNA GROUP RECIVES NEGATIVE CHARGE:

- When the DNA group recives negative charge it sends stimulus to neutral particle ,the neutral particle than converts into negative group. The other groups in the system remain constant in number. And the inert particle will remain inert.

7.How can it cure covid-19?

Covid-19 can be cured if we can generate a great amount of positive energy all at once we can weaken the virus or even kill it .if a great amount of energy at the same time then we can kill the virus if it is in the air or person.if there is a positive charge received from the surroundings(which is very likely because we are surrounded by our loved ones),second if there will be positive energy all around then there will not be any negative charge in the DNA group and if we can make the people do something or watch something that can generate positivity then the system will continuously generate positive energy which in turn makes the system in positive state .

After attaining these all requirements body is capable of producing a positive group which is temporary but has the power to kill bacteria and help the person rejuvenate itself n help to improve his/her condition. These conditions are difficult but can be done if all people produce the energy at the same time making the intensity even stronger.
