#### Abstract

In this paper we introduce and investigate weak form of Gcontinuous functions in G-metric spaces, namely $G^{\beta}$-continuous functions, via $G^{\beta}$-open sets. We give the notions of contra $G^{\beta}$-continuous functions, almost contra $G^{\beta}$-continuous functions, weakly $G^{\beta}$-continuous functions and slightly $G^{\beta}$-continuous functions.

AMS classification: Primary 54A05, 54E35.

## Keywords

continuous function; Metric spaces.

## 1. INTRODUCTION

In 2006 Mustafa and Sims , [2], introduced a new approach to generalized metric spaces, called G-metric space, and also introduced the notion of G-continuous functions. In 2021, [3], we introduced the concept of $G^{\beta}$-open sets by utilizing the open balls in G-metric spaces.

Definition 1.1. [2] Let $X$ be a nonempty set and $R$ be the set of real numbers. A function $G: X \times X \times X \rightarrow R$ is called a $G$-metric function on $X$ if it satisfies the following:
(1) $G(x, x, y)>0$ for all $x \neq y \in X$;
(2) $G(x, y, z)=0$ if and only if $x=y=z$;
(3) $G(x, x, y) \leq G(x, y, z)$ for every $x, y, z \in X$ with $y \neq z$;
(4) $G(x, y, z)=G(p(x, y, z))$ for every $x, y, z \in X$ and for any permutation p of $x, y, z$;
(5) $G(x, y, z) \leq G(x, u, u)+G(u, y, z)$ for every $x, y, z, u \in X$.

If $G$ is a $G$-metric function on $X$, then the pair $(X, G)$ is called a $G$-metric space.

Let $(X, G)$ be a $G$-metric space, $x \in X$ and $A \subseteq X$. The open ball with center $x$ and radius $\epsilon$ in metric space $(\overline{X,} G)$ is denoted by $B_{G}(x, \epsilon)$ and defined by

$$
B_{G}(x, \epsilon)=\{y \in X \mid d(x, y, y)<\epsilon\}
$$

The closed ball with center $x$ and radius $\epsilon$ in $G$-metric space $(X, G)$ is denoted by $C_{G}(x, \epsilon)$ and defined by

$$
C_{G}(x, \epsilon)=\{y \in X \mid d(x, y, y) \leq \epsilon\} .
$$

The set $A$ is called an open set in $G$-metric space $(X, G)$ if for every $x \in A$, there is $\epsilon>0$ such that $B_{G}(x, \epsilon) \subseteq A$. The set $A$ is called closed set in metric space $(X, G)$ if $X-A$ is an open set in $G$-metric space $(X, G)$.

Definition 1.2. [2] Let $(X, G)$ and $\left(X^{\prime}, G^{\prime}\right)$ be two Gmetric spaces. The function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ is called Gcontinuous at a point $a \in X$ if given $\epsilon>0$, there exists $\delta>0$ such that $x, y \in X$ and $G(a, x, y)<\delta$ implies $G^{\prime}(f(a), f(x), f(y))<$ $\epsilon$. A function $f$ is G-continuous if it is G-continuous at all points $a \in X$.

Theorem 1.3. [2] Let $(X, G)$ and $\left(X^{\prime}, G^{\prime}\right)$ be two G-metric spaces. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ is G -continuous if and only if $f^{-1}(H)$ is an open set in $(X, G)$ for every open set $H$ in $\left(X^{\prime}, G^{\prime}\right)$.

Let $(X, G)$ be a $G$-metric space and $A \subseteq X$. A point $x \in X$ is called a $G$-point of $A$ in $G$-metric space $(X, G)$, [3] if there is $\delta>0$ such that for every $y \in B_{G}(x, \delta)$,

$$
B_{G}(y, \epsilon) \cap G \neq \emptyset \quad \forall \epsilon>0 .
$$

$G^{\beta}(A)$ denotes the set of all $G^{\beta}$-points of $A$ in $G$-metric space $(X, G)$

Definition 1.4. [3] Let $(X, G)$ be a $G$-metric space. A subset $A \subseteq X$ is called a $G^{\beta}$-open set in $G$-metric space $(X, G)$ if for every $x \in A$,

$$
B_{G}(x, \epsilon) \cap G^{\beta}(A) \neq \emptyset \quad \forall \epsilon>0
$$

A subset $A \in X$ is called a $G^{\beta}$-closed set in $G$-metric space $(X, G)$ if $X-A$ is a $G^{\beta}$-open set in $G$-metric space $(X, G)$.

THEOREM 1.5. Every open set is a $G^{\beta}$-open set.
This paper is organized as follows. Section 2 introduces a class of $G^{\beta}$-continuous functions in G-metric space. Section 3 gives the notions of contra $G^{\beta}$-continuous functions, almost contra $G^{\beta}$ continuous functions, weakly $G^{\beta}$-continuous functions and slightly $G^{\beta}$-continuous functions.

## 2. $G^{\beta}$-CONTINUOUS FUNCTION

Definition 2.1. Let $(X, G)$ and ( $X^{\prime}, G^{\prime}$ ) be two G-metric spaces. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ of a G-metric space $(X, G)$ into a G-metric space $\left(X^{\prime}, G^{\prime}\right)$ is called $G^{\beta}$-continuous
function if $f^{-1}(U)$ is a $G^{\beta}$-open set in $(X, G)$ for every open set $U$ in $\left(X^{\prime}, G^{\prime}\right)$.

Theorem 2.2. Let $(X, G)$ and ( $X^{\prime}, G^{\prime}$ ) be two G-metric spaces. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ of a G-metric space $(X, G)$ into a G-metric space $\left(X^{\prime}, G^{\prime}\right)$ is $G^{\beta}$-continuous if and only if $f^{-1}(F)$ is a $G^{\beta}$-closed set in $(X, G)$ for every closed set $F$ in $\left(X^{\prime}, G^{\prime}\right)$.
Proof. Let $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ be a $G^{\beta}$-continuous and $F$ be any closed set in $\left(X^{\prime}, G^{\prime}\right)$. Then $f^{-1}\left(X^{\prime}-F\right)=X-f^{-1}(F)$ is a $G^{\beta}$-open set in $(X, G)$, that is, $f^{-1}(F)$ is $G^{\beta}$-closed set in $(X, G)$. Conversely, suppose that $f^{-1}(F)$ is a $G^{\beta}$-closed set in $(X, G)$ for every closed set $F$ in $\left(X^{\prime}, G^{\prime}\right)$. Let $U$ be any open set in $\left(X^{\prime}, G^{\prime}\right)$. Then by the hypothesis, $f^{-1}\left(X^{\prime}-U\right)=X-f^{-1}(U)$ is is a $G^{\beta}$-closed set in $(X, G)$, that is, $f^{-1}(U)$ is a $G^{\beta}$-open set in $(X, G)$. Hence $f$ is a $G^{\beta}$-continuous.

Theorem 2.3. Every G-continuous function is $G^{\beta}$ continuous function.
Proof. Let $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ be a G-continuous function and $U$ be any open set in $\left(X^{\prime}, G^{\prime}\right)$. Then $f^{-1}(U)$ is an open set in $(X, G)$ and by Theorem $\sqrt{1.5}, f^{-1}(U)$ is a $G^{\beta}$-open set in $(X, G)$. That is, $f$ is a $G^{\beta}$-continuous function.
The proof of the following lemma is similar for the proof of Theorem (2.2).

Lemma 2.4. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ of a G-metric space $(X, G)$ into a G-metric space $\left(X^{\prime}, G^{\prime}\right)$ is $G^{\beta}$ continuous if and only if $f^{-1}(F)$ is a $G^{\beta}$-closed set in $(X, G)$ for every closed set $F$ in $\left(X^{\prime}, G^{\prime}\right)$.
Let $(X, G)$ be a G-metric space and $A \subseteq X$. The closure operator of $A$ is denoted by $C l^{X}(A)$ and defined by

$$
C l^{X}(A)=\cap\{H \subseteq X: A \subseteq H \text { and } H \text { is closed set }\} .
$$

The interior functor of $A$ is denoted by $I n t^{X}(A)$ and defined by

$$
\operatorname{Int}^{X}(A)=\cup\{H \subseteq X: H \subseteq A \text { and } H \text { is open set }\} .
$$

The $G$-closure operator of $A$ is denoted by $C l_{G}^{\beta}(A)$ and defined by

$$
C l_{G}^{\beta}(A)=\cap\left\{H \subseteq X: A \subseteq H \text { and } H \text { is } G^{\beta} \text {-closed set }\right\} .
$$

The $G$-interior functor of $A$ is denoted by $I n t_{G}^{\beta}(A)$ and defined by

$$
\text { Int }{ }_{G}^{\beta}(A)=\cup\left\{H \subseteq X: H \subseteq A \text { and } H \text { is } G^{\beta} \text {-open set }\right\} .
$$

THEOREM 2.5. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ of a G-metric space $(X, G)$ into a G-metric space $\left(X^{\prime}, G^{\prime}\right)$ is $G^{\beta}$ continuous if and only if $f\left[C l_{G}^{\beta}(A)\right] \subseteq C l^{X^{\prime}}(f(A))$ for all $A \subseteq$ $X$.
Proof. Let $f$ be a $G^{\beta}$-continuous and $A$ be any subset of $(X, G)$. Then $C l^{X^{\prime}}(f(A))$ is a closed set in $\left(X^{\prime}, G^{\prime}\right)$. Since $f$ is a $G^{\beta}$-continuous then by Lemma $\sqrt[2.4]{ }, f^{-1}\left[C l^{X^{\prime}}(f(A))\right]$ is a $G^{\beta}$ closed set in $(X, G)$. That is,

$$
C l_{G}^{\beta}\left[f^{-1}\left[C l^{X^{\prime}}(f(A))\right]\right]=f^{-1}\left[C l^{X^{\prime}}(f(A))\right] .
$$

Since $f(A) \subseteq C l^{X^{\prime}}(f(A))$ then $A \subseteq f^{-1}\left[C l^{X^{\prime}}(f(A))\right]$. This implies,

$$
C l_{G}^{\beta}(A) \subseteq C l_{G}^{\beta}\left[f^{-1}\left[C l^{X^{\prime}}(f(A))\right]\right]=f^{-1}\left[C l^{X^{\prime}}(f(A))\right] .
$$

Hence $f\left[C l_{G}^{\beta}(A)\right] \subseteq C l^{X^{\prime}}(f(A))$.
Conversely, let $H$ be any closed set in $\left(X^{\prime}, G^{\prime}\right)$, that is, $C l^{X^{\prime}}(H)=$ $H$. Since $f^{-1}(H) \subseteq X$. Then by the hypothesis,

$$
f\left[C l_{G}^{\beta}\left[f^{-1}(H)\right]\right] \subseteq C l^{X^{\prime}}\left[f\left(f^{-1}(H)\right)\right] \subseteq C l^{X^{\prime}}(H)=H .
$$

This implies, $C l_{G}^{\beta}\left[f^{-1}(H)\right] \subseteq f^{-1}(H)$. Hence $C l_{G}^{\beta}\left[f^{-1}(H)\right]=$ $f^{-1}(H)$, that is, $f^{-1}(H)$ is a $G^{\beta}$-closed set in $(X, G)$. Hence by Lemma 2.4], $f$ is a $G^{\beta}$-continuous.

THEOREM 2.6. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ of a G-metric space $(X, G)$ into a $G$-metric space $\left(X^{\prime}, G^{\prime}\right)$ is $G^{\beta}$ continuous if and only if $C l_{G}^{\beta}\left(f^{-1}(B)\right) \subseteq f^{-1}\left(C l^{X^{\prime}}(B)\right)$ for all $B \subseteq X^{\prime}$.

Proof. Let $f$ be a $G^{\beta}$-continuous and $B$ be any subset of $\left(X^{\prime}, G^{\prime}\right)$. Then $C l^{X^{\prime}}(B)$ is a closed set in $\left(X^{\prime}, G^{\prime}\right)$. Since $f$ is a $G^{\beta}$-continuous then by Lemma 2.4, $f^{-1}\left[\mathrm{Cl}^{X^{\prime}}(B)\right]$ is a $G^{\beta}$ closed set in $(X, G)$. That is,

$$
C l_{G}^{\beta}\left[f^{-1}\left[C l^{X^{\prime}}(B)\right]\right]=f^{-1}\left[C l^{X^{\prime}}(B)\right] .
$$

Since $B \subseteq C l^{X^{\prime}}(B)$ then $f^{-1}(B) \subseteq f^{-1}\left[\mathrm{Cl}^{X^{\prime}}(B)\right]$. This implies,

$$
C l_{G}^{\beta}\left(f^{-1}(B)\right) \subseteq C l_{G}^{\beta}\left[f^{-1}\left[C l^{X^{\prime}}(B)\right]\right]=f^{-1}\left[C l^{X^{\prime}}(B)\right] .
$$

Hence $C l_{G}^{\beta}\left(f^{-1}(B)\right) \subseteq f^{-1}\left[C l^{X^{\prime}}(B)\right]$.
Conversely, let $H$ be any closed set in ( $X^{\prime}, G^{\prime}$ ), that is, $\mathrm{Cl}^{X^{\prime}}(H)=$ $H$. Since $H \subseteq X^{\prime}$. Then by the hypothesis,

$$
C l_{G}^{\beta}\left(f^{-1}(H)\right) \subseteq f^{-1}\left(C l^{X^{\prime}}(H)\right)=f^{-1}(H)
$$

This implies, $C l_{G}^{\beta}\left[f^{-1}(H)\right] \subseteq f^{-1}(H)$. Hence $C l_{G}^{\beta}\left[f^{-1}(H)\right]=$ $f^{-1}(H)$, that is, $f^{-1}(H)$ is a $G^{\beta}$-closed set in $(X, G)$. Hence by Lemma (2.4), $f$ is a $G^{\beta}$-continuous.

THEOREM 2.7. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ of a G-metric space $(X, G)$ into a $G$-metric space $\left(X^{\prime}, G^{\prime}\right)$ is $G^{\beta}$ continuous if and only if $f^{-1}\left(\operatorname{Int}^{X^{\prime}}(B)\right) \subseteq \operatorname{Int}_{G}^{\beta}\left[f^{-1}(B)\right]$ for all $B \subseteq X^{\prime}$.

Proof. Let $f$ be a $G^{\beta}$-continuous and $B$ be any subset of $\left(X^{\prime}, G^{\prime}\right)$. Then Int $^{X^{\prime}}(B)$ is an open set in $\left(X^{\prime}, G^{\prime}\right)$. Since $f$ is a $G^{\beta}$-continuous then $f^{-1}\left[\operatorname{Int}^{X^{\prime}}(B)\right]$ is a $G^{\beta}$-open set in $(X, G)$. That is,

$$
\operatorname{Int} t_{G}^{\beta}\left[f^{-1}\left[\operatorname{Int} X^{X^{\prime}}(B)\right]\right]=f^{-1}\left[\operatorname{Int}^{X^{\prime}}(B)\right] .
$$

Since $\operatorname{Int}^{X^{\prime}}(B) \subseteq B$ then $f^{-1}\left[\operatorname{Int}^{X^{\prime}}(B)\right] \subseteq f^{-1}(B)$. This implies,

$$
f^{-1}\left[\operatorname{Int} t^{X^{\prime}}(B)\right]=\operatorname{Int} t_{G}^{\beta}\left[f^{-1}\left[\operatorname{Int} t^{X^{\prime}}(B)\right]\right] \subseteq \operatorname{Int}_{G}^{\beta}\left(f^{-1}(B)\right) .
$$

Hence $f^{-1}\left(\operatorname{Int}^{X^{\prime}}(B)\right) \subseteq \operatorname{Int}_{G}^{\beta}\left[f^{-1}(B)\right]$.
Conversely, let $U$ be any open set in $\left(X^{\prime}, G^{\prime}\right)$, that is, $\operatorname{Int}{ }^{X^{\prime}}(U)=$ $U$. Since $U \subseteq X^{\prime}$. Then by the hypothesis,

$$
f^{-1}(U)=f^{-1}\left(I n t^{X^{\prime}}(U)\right) \subseteq I n t_{G}^{\beta}\left[f^{-1}(U)\right] .
$$

This implies, $f^{-1}(U) \subseteq \operatorname{Int}_{G}^{\beta}\left[f^{-1}(U)\right]$. Hence $f^{-1}(U)=$ Int ${ }_{G}^{\beta}\left[f^{-1}(U)\right]$, that is, $f^{-1}(U)$ is a $G^{\beta}$-open set in $(X, G)$. Hence $f$ is a $G^{\beta}$-continuous.

## 3. CONTRA $G^{\beta}$-CONTINUOUS FUNCTIONS

Definition 3.1. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ of a Gmetric space $(X, G)$ into a G -metric space $\left(X^{\prime}, G^{\prime}\right)$ is called contra $G^{\beta}$-continuous function if $f^{-1}(V)$ is a $G^{\beta}$-closed set in $(X, G)$ for every open set $V$ in $\left(X^{\prime}, G^{\prime}\right)$.

THEOREM 3.2. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ is contra $G^{\beta}$-continuous if and only if $f^{-1}(F)$ is a $G^{\beta}$-open set in $(X, G)$ for every closed set $F$ in $\left(X^{\prime}, G^{\prime}\right)$.
Theorem 3.3. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ is contra $G^{\beta}$-continuous if and only if for each $x \in X$ and each closed set $F$ in $\left(X^{\prime}, G^{\prime}\right)$ containing $f(x)$, there is a $G^{\beta}$-open set $U$ in $(X, G)$ containing $x$ such that $f(U) \subseteq F$.

Proof. Suppose that $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ is contra $G^{\beta}$ continuous. Let $x \in X$ and $F$ be a closed set in $\left(X^{\prime}, G^{\prime}\right)$ containing $f(x)$. Then by the last theorem, $U=f^{-1}(F)$ is a $G^{\beta}$-open set in $(X, G)$. Since $f(x) \in F$ then $x \in f^{-1}(F)=U$ and $f(U)=$ $f\left(f^{-1}(F)\right) \subseteq F$.
Conversely, Let $F$ be a closed set in $\left(X^{\prime}, G^{\prime}\right)$. For each $x \in$ $f^{-1}(F), f(x) \in F$. Then by the hypothesis, there is a $G^{\beta}$-open set $U_{x}$ in $(X, G)$ containing $x$ such that $f\left(U_{x}\right) \subseteq F$. Therefore, we obtain

$$
f^{-1}(F)=\cup\left\{U_{x}: x \in f^{-1}(F)\right\} .
$$

Then $f^{-1}(F)$ is a $G^{\beta}$-open set in $(X, G)$. Hence by the last theorem, $f$ is a contra $G^{\beta}$-continuous.

Definition 3.4. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ of a Gmetric space $(X, G)$ into a G-metric space $\left(X^{\prime}, G^{\prime}\right)$ is called almost $G^{\beta}$-continuous if for each $x \in X$ and each open set $V$ in ( $X^{\prime}, G^{\prime}$ ) containing $f(x)$, there is a $G^{\beta}$-open set $U$ in $(X, G)$ containing $x$ such that $f(U) \subseteq I n t_{G^{\prime}}^{\beta}\left[C l^{X^{\prime}}(V)\right]$.
A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ of a G-metric space $(X, G)$ into a G-metric space ( $X^{\prime}, G^{\prime}$ ) is called $G^{\beta}$-open function if $f(V)$ is a $G^{\beta}$-open set in ( $X^{\prime}, G^{\prime}$ ) for every $G^{\beta}$-open set $V$ in $(X, G)$.

Theorem 3.5. If a function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ is a $G^{\beta}$-open function and contra $G^{\beta}$-continuous then $f$ is an almost $G^{\beta}$-continuous.

Proof. Let $x \in X$ be any point in $(X, G)$ and $V$ be any open set in $\left(X^{\prime}, G^{\prime}\right)$ containing $f(x)$. Since $f$ ia contra $G^{\beta}$-continuous and $C l^{X^{\prime}}(V)$ be a closed set in $\left(X^{\prime}, G^{\prime}\right)$ containing $f(x)$ then by Theorem (3.3), there is a $G^{\beta}$-open set $U$ in $(X, G)$ containing $x$ such that $f(U) \subseteq C l^{X^{\prime}}(V)$. Since $f$ is a $G^{\beta}$-open function and $U$ is a $G^{\beta}$-open set in $(X, G)$ then $f(U)$ is a $G^{\beta}$-open set in $\left(X^{\prime}, G^{\prime}\right)$ and
$f(U)=\operatorname{Int}_{G^{\prime}}^{\beta}[f(U)] \subseteq \operatorname{Int}_{G^{\prime}}^{\beta}\left[C l^{X^{\prime}}(f(U))\right] \subseteq \operatorname{Int}_{G^{\prime}}^{\beta}\left[\mathrm{Cl}^{X^{\prime}}(V)\right]$. This shows that $f$ is an almost $G^{\beta}$-continuous.
Definition 3.6. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ of a G-metric space $(X, G)$ into a G-metric space $\left(X^{\prime}, G^{\prime}\right)$ is called weakly $G^{\beta}$-continuous function if for each $x \in X$ and each open set $V$ in $\left(X^{\prime}, G^{\prime}\right)$ containing $f(x)$, there is a $G^{\beta}$-open set $U$ in $(X, G)$ containing $x$ such that $f(U) \subseteq C l^{X^{\prime}}(V)$.
It is clear that every a $G^{\beta}$-continuous function is a weakly $G^{\beta}$-continuous function.

A subset of G-metric space is called a clopen set if it is both open and closed set, similar for $G^{\beta}$-clopen set.

Definition 3.7. A function $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ of a G-metric space $(X, G)$ into a G-metric space $\left(X^{\prime}, G^{\prime}\right)$ is called slightly $G^{\beta}$-continuous function if for each $x \in X$ and each clopen set $U$ in $\left(X^{\prime}, G^{\prime}\right)$ containing $f(x)$, there exists $G^{\beta}$-open set $V$ in $(X, G)$ containing $x$ such that $f(V) \subseteq U$.

Theorem 3.8. Let $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ be a function of a G-metric space $(X, G)$ into a G-metric space $\left(X^{\prime}, G^{\prime}\right)$. Then the following are equivalent:
(1) $f$ is slightly $G^{\beta}$-continuous.
(2) $f^{-1}(U)$ is a $G^{\beta}$-open set in $(X, G)$ for every clopen set $U$ in $\left(X^{\prime}, G^{\prime}\right)$.
(3) $f^{-1}(U)$ is a $G^{\beta}$-closed set in $(X, G)$ for every clopen set $U$ in $\left(X^{\prime}, G^{\prime}\right)$.
(4) $f^{-1}(U)$ is a $G^{\beta}$-cloopen set in $(X, G)$ for every clopen set $U$ in $\left(X^{\prime}, G^{\prime}\right)$.
Proof. $1 \Rightarrow 2$ : Let $U$ be a clopen set in $\left(X^{\prime}, G^{\prime}\right)$. For each $x \in$ $f^{-1}(U), f(x) \in U$. Since $f$ is slightly $G^{\beta}$-continuous then there exists $G^{\beta}$-open set $V_{x}$ in $(X, G)$ containing $x$ such that $f\left(V_{x}\right) \subseteq$ $U$. This implies, $x \in V_{x} \subseteq f^{-1}(U)$. Hence

$$
f^{-1}(U)=\cup\left\{V_{x}: x \in f^{-1}(U)\right\} .
$$

That is, $f^{-1}(U)$ is a $G^{\beta}$-open set in $(X, G)$.
$2 \Rightarrow 3$ : Let $U$ be a clopen set in $\left(X^{\prime}, G^{\prime}\right)$. Then $X^{\prime}-U$ is a clopen set in $\left(X^{\prime}, G^{\prime}\right)$. By the hypothesis, $X-f^{-1}(U)=f^{-1}\left(X^{\prime}-U\right)$ is a $G^{\beta}$-open set in $(X, G)$. That is, $f^{-1}(U)$ is a $G^{\beta}$-closed set in $(X, G)$.
$3 \Rightarrow 4$ : It is easy from the previous.
$4 \Rightarrow$ 1: Let $x \in X$ be any point in $(X, G)$ and $U$ be a clopen set in $\left(X^{\prime}, G^{\prime}\right)$ containing $f(x)$. By the hypothesis, $f^{-1}(U)$ is a $G^{\beta}$ cloopen set in $(X, G)$. Then $V=f^{-1}(U)$ is a $G^{\beta}$-open set $V$ in $(X, G)$ containing $x$ such that $f(V) \subseteq U$. That is, $f$ is slightly $G^{\beta}$-continuous.

THEOREM 3.9. Every weakly $G^{\beta}$-continuous is slightly $G^{\beta}$ continuous.

Proof. Let $f:(X, G) \rightarrow\left(X^{\prime}, G^{\prime}\right)$ be a weakly $G^{\beta}$ continuous function. Let $x \in X$ be any point in $(X, G)$ and $U$ be any clopen set in $\left(X^{\prime}, G^{\prime}\right)$ containing $f(x)$. Then $U$ is an open set in ( $X^{\prime}, G^{\prime}$ ) containing $f(x)$. Then there is a $G^{\beta}$-open set $V$ in $(X, G)$ containing $x$ such that $f(V) \subseteq C l(U)=U$. Hence $f$ is slightly $G^{\beta}$-continuous.
