Abstract

In this work, a stress is given on the evaluation of performance measures of a parallel system under priority with necessary conditions on operation and repair times. The units are identical in nature subject to constant failure. There is a single server who visits the system immediately to rectify the faults whenever occurred in the system. The system undergoes for preventive maintenance after a pre-specific time ‘t’ up to which no failure occurs. However, repair of the unit is done at its failure. And, the unit is replaced by new one in case its repair is not possible by the server in a given maximum repair time. The maintenance and repair activities are perfect. Priority is given to preventive maintenance of one unit over repair of the other. The random variables associated with failure, preventive maintenance, repair and replacement times are statistically independent. The failure time and the time by which unit undergoes for preventive maintenance and replacement follow negative exponential distribution, whereas the distributions for preventive maintenance, repair and replacement rates are taken as arbitrary with different probability density functions. The system is observed at suitable regenerative epochs by using semi-Markov process and regenerative point technique. Graphs are drawn to depict the behavior of some important reliability measures giving particular values to the parameters and costs. The profit of the system model has also been evaluated considering different cost policies.

Keywords: Parallel System, Priority, Preventive Maintenance, Maximum Operation and Repair Times and Performance Measures.

1. Introduction

The importance of parallel operation of components in repairable systems has been felt by the users in view of their load sharing capacity and the ability to provide better services for a reasonable period. And, so research work on stochastic modeling of such systems has been propagated by the scholars and engineers including Kumar et al. (2010) and Malik and Gitangali (2012). They assumed that system can work for a long period without requiring any type of maintenance. But, sometimes a system has to work in varying environmental conditions and so deteriorates due to continued operation and ageing. In such a situation, preventive maintenance of the system can be conducted after a maximum operation of time to slow the deteriorate process. Malik and Barak (2013) studied a cold stand by system with preventive maintenance and repair.

Further, the performance of a system can be enhanced by giving priority in repair disciplines and also replacing the failed component by new one in case their repair time is too long. Singh and Agrafoites (1995), Kumar and Malik (2012) and Malik (2013) analyzed systems with cold standby redundancy under the aspects of priority in repair disciplines, maximum operation and repair times.

While considering the practical situations in mind, here reliability measures of a parallel system have been evaluated using the concepts of priority, maximum operation and repair times. The units are identical in nature subject to constant failure. There is a single server who visits the
system immediately to rectify the faults which occur during operation of the system. The system undergoes for preventive maintenance after a pre-specific time ‘t’ up to which no failure occurs. However, repair of the unit is done at its failure. And, the unit is replaced by new one in case its repair is not possible by the server in a given maximum repair time. The unit works as new after preventive maintenance and repair. Priority is given to preventive maintenance of one unit over repair of the other. The random variables associated with failure, preventive maintenance, repair and replacement times are statistically independent. The failure time and the time by which unit undergoes for preventive maintenance and replacement follow negative exponential distribution, whereas the distributions for preventive maintenance, repair and replacement rates are taken as arbitrary with different probability density functions. The system is observed at suitable regenerative epochs by using semi-Markov process and regenerative point technique to drive expressions for transition probabilities, mean sojourn times, mean time to system failure(MTSF), availability, busy period of the server due to repair, preventive maintenance and replacement, expected number of repairs, preventive maintenances and replacements and finally, the profit function. Graphs are drawn to depict the behavior of some important reliability measures giving particular values to the parameters and costs. The profit of the system model has also been evaluated considering different cost policies.

**Transition State Diagram**

![Transition State Diagram](image)

**Fig. 1**
3. Transition Probabilities and Mean Sojourn Times

Simple probabilistic considerations yield the following expressions for the non-zero elements

\[ p_{ij} = Q_0(x) = \int_0^\infty q_{ij}(t) dt \]  

\[ p_{ij} = \frac{2\lambda}{2\lambda + \alpha_0}, \quad p_{02} = \frac{\alpha_0}{2\lambda + \alpha_0}, \quad p_{10} = g^* (\lambda + \alpha_0 + \beta_0), \quad p_{13} = \frac{\lambda}{(\lambda + \alpha_0 + \beta_0)} (1 - g^* (\lambda + \alpha_0 + \beta_0)), \]

\[ p_{14} = \frac{\beta_0}{(\lambda + \alpha_0 + \beta_0)} (1 - g^* (\lambda + \alpha_0 + \beta_0)), \quad p_{15} = \frac{\alpha_0}{(\lambda + \alpha_0 + \beta_0)} (1 - g^* (\lambda + \alpha_0 + \beta_0)), \quad p_{31} = g^* (\beta_0), \]

\[ p_{37} = 1 - g^* (\beta_0), \quad p_{1137} = \frac{\lambda}{(\lambda + \alpha_0 + \beta_0)} (1 - g^* (\beta_0))(1 - g^* (\lambda + \alpha_0 + \beta_0)), \quad p_{40} = r^* (\lambda + \alpha_0), \]

\[ p_{49} = p_{46.9} = \frac{\alpha_0}{(\lambda + \alpha_0)} (1 - r^* (\lambda + \alpha_0)), \quad p_{51} = r_{66.10} = \frac{\alpha_0}{(\lambda + \alpha_0)} (1 - f^* (\lambda + \alpha_0)), \]

\[ p_{60} = f^* (\lambda + \alpha_0), \quad p_{61.11} = \frac{\lambda}{(\lambda + \alpha_0)} (1 - f^* (\lambda + \alpha_0)), \]

\[ p_{26} = p_{31} = p_{81} = p_{96} = p_{10,6} = p_{11,1} = 1 \]  

\[ R^* (s) = \frac{1 - \phi^* (s)}{s} \]  

The reliability of the system model can be obtained by taking Inverse Laplace transform of (5). The mean time to system failure (MTSF) is given by

\[ MTSF = \lim_{s \to 0} \frac{1 - \phi^* (s)}{s} = \frac{N}{D}, \]
where,
\[ N = \mu_0 + p_{01} \mu_1 + p_{01} p_{14} \mu_4 \quad \text{and} \quad D = 1 - p_{01} p_{10} - p_{01} p_{14} p_{40} \]  
(7)

5. Steady State Availability

Let \( A_i(t) \) be the probability that the system is in up-state at instant ‘t’ given that the system entered regenerative state \( S_i \) at \( t = 0 \). The recursive relations for \( A_i(t) \) are given as:

\[
\begin{align*}
A_0(t) &= M_0(t) + q_{01}(t) \circ A_1(t) + q_{02}(t) \circ A_2(t) \\
A_1(t) &= M_1(t) + q_{10}(t) \circ A_0(t) + q_{14}(t) \circ A_4(t) + q_{15}(t) \circ A_5(t) + (q_{11.3}(t) + q_{11.37}(t)) \circ A_1(t) \\
A_2(t) &= q_{26}(t) \circ A_6(t) \\
A_4(t) &= M_4(t) + q_{40}(t) \circ A_0(t) + q_{41.8}(t) \circ A_1(t) + q_{46.9}(t) \circ A_6(t) \\
A_5(t) &= q_{51}(t) \circ A_1(t) \\
A_6(t) &= M_6(t) + q_{60}(t) \circ A_0(t) + q_{66.10}(t) \circ A_6(t) + q_{61.11}(t) \circ A_1(t) \\
\end{align*}
\]
(8)

Where,
\[
\begin{align*}
M_0(t) &= e^{-(\lambda+\alpha_0)t} \\
M_1(t) &= e^{-(\lambda+\alpha_0+\beta_0)t} G(t) \\
M_4(t) &= e^{-(\lambda+\alpha_0)t} R(t) \\
M_6(t) &= e^{-(\lambda+\alpha_0)t} F(t) \\
\end{align*}
\]
(9)

Taking LT of above relations (8) and solving for \( A_0^*(s) \). The steady state availability is given by
\[ A_0(\infty) = \lim_{s \to 0} s A_0^*(s) = \frac{N_1}{D_1}, \]
(10)

where
\[
\begin{align*}
N_1 &= (\mu_0 X + (\mu_1 + \mu_4 p_{14}) Y + \mu_6 Z) \\
D_1 &= X (\mu_0 + \mu_2 p_{02}) + Y (\mu_1 + \mu_4 p_{14} + \mu_5 p_{15}) + Z \mu_6 \\
\end{align*}
\]
(11)

6. Busy Period Analysis for Server

(a) Due to Repair

Let \( B_i^R(t) \) be the probability that the server is busy in repair the unit at an instant ‘t’ given that the system entered regenerative state \( S_i \) at \( t = 0 \). The recursive relations for \( B_i^R(t) \) are as follows:

\[
\begin{align*}
B_0^R(t) &= q_{01}(t) \circ B_1^R(t) + q_{02}(t) \circ B_2^R(t) \\
B_1^R(t) &= W_1(t) + q_{10}(t) \circ B_0^R(t) + (q_{11.37}(t) + q_{11.3}(t)) \circ B_1^R(t) + q_{14}(t) \circ B_4^R(t) + q_{15}(t) \circ B_5^R(t) \\
B_2^R(t) &= q_{26}(t) \circ B_6^R(t) \\
B_4^R(t) &= q_{40}(t) \circ B_0^R(t) + q_{41.8}(t) \circ B_1^R(t) + q_{46.9}(t) \circ B_6^R(t) \\
B_5^R(t) &= q_{51}(t) \circ B_1^R(t) \\
B_6^R(t) &= q_{60}(t) \circ B_0^R(t) + q_{61.11}(t) \circ B_1^R(t) + q_{66.10}(t) \circ B_6^R(t) \\
\end{align*}
\]
(13)

where,
\[
W_1(t) = e^{-(\lambda+\alpha_0+\beta_0)t} G(t) + (\lambda e^{-(\lambda+\alpha_0+\beta_0)t} \circ l) G(t) \]
(14)

Taking LT of above relations (13) and solving for \( B_0^R^*(s) \). The time for which server is busy due to repair is given by
\[ B_0^R(\infty) = \lim_{s \to 0} B_0^{R^*}(s) = \frac{N_2}{D_1}, \quad (15) \]

Where
\[ N_2 = W_1^*(0)Y \quad \text{and} \quad D_1 \text{ is already mentioned.} \quad (16) \]

(b) Due to Replacement

Let \( B_i^{Rp}(t) \) be the probability that the server is busy in replacement the unit at an instant ‘t’ given that the system entered regenerative state \( S_i \) at \( t=0 \). The recursive relations for \( B_i^{Rp}(t) \) are as follows:

\[ B_0^{Rp}(t) = q_{01}(t) \odot B_1^{Rp}(t) + q_{02}(t) \odot B_2^{Rp}(t) \]
\[ B_1^{Rp}(t) = q_{10}(t) \odot B_0^{Rp}(t) + (q_{113.7}(t) + q_{113}(t)) \odot B_1^{Rp}(t) + q_{14}(t) \odot B_4^{Rp}(t) + q_{15}(t) \odot B_5^{Rp}(t) \]
\[ B_2^{Rp}(t) = q_{26}(t) \odot B_6^{Rp}(t) \]
\[ B_4^{Rp}(t) = W_4(t) + q_{40}(t) \odot B_0^{Rp}(t) + q_{41.8}(t) \odot B_1^{Rp}(t) + q_{46.9}(t) \odot B_6^{Rp}(t) \]
\[ B_5^{Rp}(t) = q_{51}(t) \odot B_4^{Rp}(t) \]
\[ B_6^{Rp}(t) = q_{60}(t) \odot B_0^{Rp}(t) + q_{61.11}(t) \odot B_1^{Rp}(t) + q_{66.10}(t) \odot B_6^{Rp}(t) \quad (17) \]

where,
\[ W_4(t) = e^{-\lambda_{0} \odot R(t)} + (\lambda e^{-\lambda_{0} \odot R(t)}) \odot 1 \]
\[ (18) \]

Taking LT of above relations (17) and solving for \( B_0^{Rp*}(s) \). The time for which server is busy due to replacement is given by

\[ B_0^{Rp}(\infty) = \lim_{s \to 0} B_0^{Rp*}(s) = \frac{N_3}{D_1} \quad (19) \]

Where
\[ N_3 = W_4^*(0)p_{14}Y \quad \text{and} \quad D_1 \text{ is already mentioned.} \quad (20) \]

(c) Due to Preventive Maintenance

Let \( B_i^P(t) \) be the probability that the server is busy in preventive maintenance the unit at an instant ‘t’ given that the system entered regenerative state \( S_i \) at \( t=0 \). The recursive relations for \( B_i^P(t) \) are as follows:

\[ B_0^P(t) = q_{01}(t) \odot B_1^P(t) + q_{02}(t) \odot B_2^P(t) \]
\[ B_1^P(t) = q_{10}(t) \odot B_0^P(t) + (q_{113.7}(t) + q_{113}(t)) \odot B_1^P(t) + q_{14}(t) \odot B_4^P(t) + q_{15}(t) \odot B_5^P(t) \]
\[ B_2^P(t) = W_2(t) + q_{26}(t) \odot B_6^P(t) \]
\[ B_4^P(t) = q_{40}(t) \odot B_0^P(t) + q_{41.8}(t) \odot B_1^P(t) + q_{46.9}(t) \odot B_6^P(t) \]
\[ B_5^P(t) = W_5(t) + q_{51}(t) \odot B_4^P(t) \]
\[ B_6^P(t) = W_6(t) + q_{60}(t) \odot B_0^P(t) + q_{61.11}(t) \odot B_1^P(t) + q_{66.10}(t) \odot B_6^P(t) \quad (21) \]
Where,
\[ W_2(t) = W_5(t) = F(t) \]
\[ W_6(t) = e^{-(\lambda + \alpha_0)t} \left( F(t) + (\alpha_0 e^{-(\lambda + \alpha_0)t} \mathbb{I}) F(t) + (\lambda e^{-(\lambda + \alpha_0)t} \mathbb{I}) F(t) \right) \] (22)
Taking LT of above relations (21) and solving for \( B_0^{ps}(s) \). The time for which server is busy due to preventive maintenance is given by
\[ B_0^{ps}(\infty) = \lim_{s \to 0} sB_0^{ps}(s) = \frac{N_4}{D_1} \] (23)

Where,
\[ N_4 = W_2^*(0)p_{02}X + W_5^*(0)p_{13}Y + W_6^*(0)Z \] and \( D_1 \) is already mentioned. (24)

7. Expected Number of Repairs

Let \( R_i(t) \) be the expected number of repairs by the server in \((0, t]\) given that the system entered the regenerative state \( S_i \) at \( t = 0 \). The recursive relations for \( R_i(t) \) are given as:
\[ R_0(t) = Q_{01}(t) \mathbb{S} R_1(t) + Q_{02}(t) \mathbb{S} R_2(t) \]
\[ R_1(t) = Q_{40}(t) \mathbb{S} R_0(t) + Q_{11.3}(t) \mathbb{S} (1 + R_1(t)) + Q_{14.37}(t) \mathbb{S} R_1(t) + Q_{14}(t) \mathbb{S} R_4(t) + Q_{15}(t) \mathbb{S} R_3(t) \]
\[ R_2(t) = Q_{26}(t) \mathbb{S} R_5(t) \]
\[ R_4(t) = Q_{40}(t) \mathbb{S} R_0(t) + Q_{41.8}(t) \mathbb{S} R_1(t) + Q_{46.9}(t) \mathbb{S} R_6(t) \]
\[ R_5(t) = Q_{51}(t) \mathbb{S} R_1(t) \]
\[ R_6(t) = Q_{60}(t) \mathbb{S} R_0(t) + Q_{61.11}(t) \mathbb{S} R_4(t) + Q_{66.10}(t) \mathbb{S} R_5(t) \] (25)
Taking LST of above relations (25) and solving for \( R_0^{**}(s) \). The expected no. of repairs per unit time by the server are given by
\[ R_0(\infty) = \lim_{s \to 0} sR_0^{**}(s) = \frac{N_5}{D_1} \] (26)
where
\[ N_5 = (p_{10} + p_{11.3})Y \] and \( D_1 \) is already mentioned. (27)

8. Expected Number of Replacements

Let \( R_p(t) \) be the expected number of replacements by the server in \((0, t]\) given that the system entered the regenerative state \( S_i \) at \( t = 0 \). The recursive relations for \( R_p(t) \) are given as:
\[ R_{p0}(t) = Q_{01}(t) \mathbb{S} R_{p1}(t) + Q_{02}(t) \mathbb{S} R_{p2}(t) \]
\[ R_{p1}(t) = Q_{40}(t) \mathbb{S} R_{p0}(t) + Q_{11.3}(t) \mathbb{S} (1 + R_{p1}(t)) + Q_{14.37}(t) \mathbb{S} R_{p1}(t) + Q_{14}(t) \mathbb{S} R_{p4}(t) + Q_{15}(t) \mathbb{S} R_{p5}(t) \]
\[ R_{p2}(t) = Q_{26}(t) \mathbb{S} R_{p6}(t) \]
\[ R_{p4}(t) = Q_{40}(t) \mathbb{S} (1 + R_{p0}(t)) + Q_{41.8}(t) \mathbb{S} (1 + R_{p1}(t)) + Q_{46.9}(t) \mathbb{S} (1 + R_{p6}(t)) \]
\[ R_{p5}(t) = Q_{51}(t) \mathbb{S} R_{p1}(t) \]
\[ R_{p6}(t) = Q_{60}(t) \mathbb{S} R_{p0}(t) + Q_{61.11}(t) \mathbb{S} R_{p4}(t) + Q_{66.10}(t) \mathbb{S} R_{p5}(t) \] (28)
Taking LST of above relations (28) and solving for \( R_{p0}^{**}(s) \). The expected no. of replacements per unit time by the server are given by
\[ R_{P_0}(\infty) = \lim_{s \to 0} R_{P_0}^{**}(s) = \frac{N_6}{D_1}, \]  

where

\[ N_6 = (p_{14} + p_{11.37})Y \quad \text{and} \quad D_1 \text{ is already mentioned.} \]  

9. Expected Number of Preventive Maintenances

Let \( P_i(t) \) be the expected number of preventive maintenance by the server in \( (0, t] \) given that the system entered the regenerative state \( S_i \) at \( t = 0 \). The recursive relations for \( P_i(t) \) are given as:

\[
P_0(t) = Q_{01}(t)S_{P1}(t) + Q_{02}(t)S_{P2}(t) \]
\[
P_1(t) = Q_{10}(t)S_{P0}(t) + (Q_{11.3}(t) + Q_{11.37}(t))S_{P1}(t) + Q_{14}(t)S_{P4}(t) + Q_{15}(t)S_{P5}(t) \]
\[
P_2(t) = Q_{26}(t)S_{P0}(t) + Q_{26}(t)(1 + P_6(t)) \]
\[
P_4(t) = Q_{40}(t)S_{P0}(t) + Q_{41.8}(t)S_{P1}(t) + Q_{46.9}(t)S_{P6}(t) \]
\[
P_5(t) = Q_{51}(t)S_{P0}(t) + Q_{51}(t)(1 + P_6(t)) \]
\[
P_6(t) = Q_{60}(t)S_{P0}(t) + Q_{61.11}(t)S_{P1}(t) + Q_{66.10}(t)S_{P6}(t) \]

(31)

Taking LST of above relations (31) and solving for \( P_0^{**}(s) \). The expected no. of preventive maintenances per unit time by the server are given by

\[ P_0(\infty) = \lim_{s \to 0} sP_0^{**}(s) = \frac{N_7}{D_1}, \]  

(32)

Where

\[ N_7 = p_{02}X + p_{15}Y + Z \quad \text{and} \quad D_1 \text{ is already mentioned.} \]  

And

\[ X = (1 - p_{66.10})(p_{10} + p_{14}p_{40}) + p_{14}p_{49}p_{60} \]
\[ Y = \frac{\lambda(2\lambda + 2\alpha + \alpha_0)}{(2\lambda + \alpha_0)(\alpha + \lambda + \alpha_0)} \]
\[ Z = \frac{\beta_0\alpha_0(2\lambda + \alpha_0)(2\lambda + \lambda + \alpha_0 + \beta) + 2\lambda\alpha_0(\theta + \lambda + \alpha_0 + \beta_0)(\beta + \lambda + \alpha_0)}{(\theta + \lambda + \alpha_0 + \beta_0)(\beta + \lambda + \alpha_0)(2\lambda + \alpha_0)^2} \]  

10. Profit Analysis

The profit incurred to the system model in steady state can be obtained as

\[ P_1 = K_0A_0 - K_1B_0^R - K_2B_0^{RP} - K_3B_0^P \]
\[ P_2 = K_0A_0 - K_4B_0 - K_5B_0 - K_6B_0 \]

Where

\[ P_1 = \text{Profit of the system model after reducing cost of the repair activities of server} \]
\[ P_2 = \text{Profit of the system model after reducing cost of expected number of repair activities} \]
\[ K_0 = \text{Revenue per unit up-time of the system} \]
\[ K_1 = \text{Cost per unit time for which server is busy due to repair} \]
\[ K_2 = \text{Cost per unit time for which server is busy due to replacement} \]
\[ K_3 = \text{Cost per unit time for which server is busy due to preventive maintenance} \]
$K_4 = \text{Cost per unit time repair}$

$K_5 = \text{Cost per unit time replacement}$

$K_6 = \text{Cost per unit time preventive maintenance}$

11. Conclusion

The reliability measures of a parallel system giving priority to preventive maintenance over repair have been obtained for the particular case $g(t) = \theta e^{-\theta t}$, $r(t) = \beta e^{-\beta t}$ and $f(t) = \alpha e^{-\alpha t}$. To make the study more concrete and effective, the graphs for MTSF, availability and profit are drawn with respect to failure rate ($\lambda$) for fixed values of other parameters as shown respectively in figures 2, 3, 4 and 5. The results indicate that MTSF, availability and profit go on decreasing with the increase of failure rate ($\lambda$) and the rate ($\alpha_0$) by which the unit undergoes for preventive maintenance. However, their values increase with the increase of repair rate ($\theta$) and replacement rate ($\beta$). Further, MTSF and availability increase as and when the rate ($\beta_0$) increases while profit declines. The profit of the system model has also been obtained under two aspects of costs—one is by considering cost of busy period of the server due to repair activities and the other by giving separate cost of each repair activity to the server. It is analyzed that the system would be more profitable if cost is paid to the server for his busy period rather than cost to each repair activity.

**PROFIT1 Vs FAILURE RATE ($\lambda$)**

- $\alpha_0=0.2, \beta_0=3, \theta=2.1, \alpha=5, \beta=10$
- $\alpha_0=0.201, \alpha=7, \beta=5$
- $\beta_0=1, \theta=4.1$

K0=15000, K1=3000, K2=3500, K3=2000, K4=2000, K5=3000, K6=1500

*Fig. 4*

**PROFIT2 Vs FAILURE RATE ($\lambda$)**

- $\alpha_0=0.2, \beta_0=3, \theta=2.1, \alpha=5, \beta=10$
- $\alpha_0=0.201, \alpha=7, \beta=5$
- $\beta_0=1, \theta=4.1$

K0=15000, K1=3000, K2=3500, K3=2000, K4=2000, K5=3000, K6=1500
