Diffusion and Convection In An Elliptic Tube

S. D. Bagde and N. W. Khobragade

Abstract- This paper presents the theoretical treatment of diffusion and convection in an elliptic tube. And the differential equation for gas or liquid streaming in a tube in steady state in elliptical co-ordinates by using the Marchi-Fasulo transforms technique.

Key Words- Diffusion and convection, Elliptic tube, Marchi-Fasulo transforms

1. INTRODUCTION

Diffusion equation playas an important role in Biological science. If we inject a subject in a tube filled with solvent liquid the molecules of the subject are in random motion. They will spread in all directions. Such problem for one dimension when the solvent liquid is not in motion, have been worked out in [1]. Such problems for circular tube, when the diffusion is in direction of flow have been worked out in [1]. Geeta Shrivastava [3] studied the diffusion and convection problem in an elliptical tube .also In this paper, we discuss the same problem by using Marchi-Fasulo transform technique.

2. STATEMENT OF THE PROBLEM

The differential equation for gas or liquid streaming in a tube in steady state in elliptical co-ordinates (z), using McLachlan [2], for diffusion and convection in elliptical tube given by

\[ D \left( \frac{2h^2}{\cosh 2\xi + \cos 2\eta} \left( \frac{\partial^2 C}{\partial \xi^2} + \frac{\partial^2 C}{\partial \eta^2} \right) + \frac{\partial C}{\partial z} \right) - v \frac{\partial C}{\partial z} = 0 \]  

(1)

Where \( x = h \cosh \xi, \cos \eta, \)

\( y = h \sinh \xi, \sin \eta, \)

\( z = z \)

(2)

(3)

The direction of flow is supposed to coincide with Z- axis.

The boundary conditions are

\[ C = C_0 \text{ at } Z = 0 \quad ; \quad 0 \leq \eta \leq 2\pi \]

\[ C = 0 \text{ at } \xi = \xi_0 \quad ; \quad 0 \leq \xi \leq \xi_0 \]

\( Z > 0 \)

\[ C(\xi, \eta, z) + k_1 \frac{\partial C(\xi, \eta, z)}{\partial z} \bigg|_{z=h} = 0 \]

(4)

\[ C(\xi, \eta, z) + k_2 \frac{\partial C(\xi, \eta, z)}{\partial z} \bigg|_{z=-h} = 0 \]

(5)

Here

\( C = \) Concentration of the diffusing substance,

\( D = \) Diffusivity,

\( h = \) Half the interfocal length of the ellipse,

\( v = \) velocity of Liquid,

3. Solution of the problem

Putting \( C = R(\xi, \eta), Z(z) \)

\[ \frac{2h^2}{\cosh 2\xi + \cos 2\eta} \left( \frac{\partial^2 R}{\partial \xi^2} + \frac{\partial^2 R}{\partial \eta^2} \right) + \frac{1}{Z} \frac{d}{dz} \left( Z \frac{d Z}{d z} \right) v \frac{d Z}{d z} = -\lambda^2 \]

(6)

(7)

Separating the variables,

\[ \frac{1}{Z} \left( \frac{d^2 Z}{d z^2} - \frac{v}{Z} \frac{d Z}{d z} \right) = -\lambda^2 \]

  (E-mail: sunilkumarbagde@rediffmail.com ).

• N. W. Khobragade, Professor in the P.G Department of Maths,RTM Nagpur University Nagpur, INDIA

http://www.ijser.org
\[
\frac{d^2 Z}{dz^2} - \frac{v dZ}{D dz} + \lambda^2 Z = 0
\]
(9)

\[
m = \frac{a \pm \sqrt{a^2 - 4\lambda^2}}{2}
\]
where \(a = \frac{v}{D}\)
(10)

\[
\theta_{2n,m} = \frac{1}{\pi} \int_0^{2\pi} e_z(\eta, q_{2n,m}) \cos 2\eta d\eta
\]
(19)

\[
= A_{0,2}^{(2\eta)} A_{2}^{(2\eta)} + \sum_{r=0}^{\infty} A_{2r}^{(2\eta)} A_{2r+2}^{(2\eta)}
\]
(20)

We define the transform with respect to \(z\) as

\[
\bar{C}(\xi, \eta, \zeta) = \int\limits_{-h}^{h} C(\xi, \eta, z) P_m(z) dz
\]
(21)

Its inverse transform is

\[
C(\xi, \eta, z) = \sum_{m=1}^{\infty} \bar{C}(\xi, \eta, \zeta) P_m(z)
\]
(22)

Applying the Marchi-Fasulo transform defined in (21) to the equations (1) and using (4), (5) one obtains

\[
\left( \frac{2d^2}{\cos(2\eta) - \cos(2\eta)} \right) \left( \frac{d^2 \bar{C}}{d\zeta^2} + \frac{d^2 \bar{C}}{d\eta^2} \right) = a_m^2 \bar{C}
\]
(23)

Where the Eigen values \(a_m\) are the solutions of the equation

\[
[\alpha_1 a \cos(ab) + \beta_1 \sin(ab)] \times [\beta_2 \cos(ab) + \alpha_2 a \sin(ab)]
\]

\[
= [\alpha_2 a \cos(ab) - \beta_2 \sin(ab)] \times [\beta_1 \cos(ab) - \alpha_1 a \sin(ab)]
\]
(24)

Where \(\bar{C}\) denotes the Marchi-Fasulo transform of \(C\) and \(\xi\) denotes the Marchi-Fasulo transform parameter.

### 4. CONCLUSION

In this paper, we have investigated diffusion and convection in an elliptic tube. And differential equation for gas or liquid streaming in a tube in steady state in elliptical co-ordinates by using the Marchi-Fasulo transforms technique. The expressions are represented graphically.
