ABSTRACT - In this paper presents analysis of grid connected PV system with maximum power point tracking (MPPT) control. Grid interconnection of photovoltaic (PV) power generation systems has the advantage of effective utilization of generated power because there are no storage losses involved. Grid-connected photovoltaic system simulates in MATLAB/Simulink. The key technology of a PV system includes PV cell modeling, maximum power point tracking (MPPT) algorithm, DC/DC converter and grid-connected DC/AC inverter. MPPT is used for extracting the maximum power from the PV cell and transferring that power to the load. A DC/DC converter acts as an interface between the load and the PV cell. It is used for transferring maximum power from the solar PV cell to load. The DC/AC Inverter is used to regulate the output voltage of DC/DC converter and connects the PV cell with DC/AC converter to the grid. The output voltage is required to be sinusoidal and in phase with the grid voltage.

Keywords— photovoltaic system, MPPT, grid-connected

INTRODUCTION

Among a variety of renewable energy sources, solar energy is predicted to become the largest contributors to world energy for its clean and no supply limitations characteristic. Over the past decade, PV technology has shown the potential by robust and continuous growth even during times of financial crisis. Grid interconnection of photovoltaic (PV) power generation system has the advantage of more effective utilization of generated power.

As day by day the demand of electricity is increased and that much demand cannot be meeting up by the conventional power plant. And also these power plants create pollution. If we look at the nature of load demand curve it is found that demand is increased from morning for different causes like opening the shops, markets, schools, colleges, offices etc and that increases demand remains upto around 5 PM, and from the study of the PV system it is found that, it is very much ideal to meet that increased energy demand by using grid connected PV. That’s why we go for grid connected topology.

Grid interconnected photovoltatic system is accomplished through the inverter, which convert DC power generated from PV modules to AC power used for ordinary power supply for electrical equipments. Inverter system is therefore very important for grid connected PV system. It is also required to generate high quality power to AC utility system with reasonable cost. By mean of high frequency switching of semiconductor device with PWM (Pulse width modulation) technologies, high power factor and low harmonic distortion power can be generated.

The key technology of a PV system includes PV cell modeling, maximum power point tracking (MPPT) algorithm, DC/DC converter and grid-connected DC/AC inverter.
MODELING OF PHOTOVOLTAIC CELL

(I)- Ideal PV Cell

Photovoltaic (PV) cell is a semiconductor device that absorbs and converts the energy of light into electricity by photovoltaic effect.

![Equivalent circuit of ideal PV cell](image)

The voltage-current characteristic equation of a solar cell is given as (1):

\[ I = I_{ph} - \left[ \exp\left(\frac{q(V + I R_s)/k T c A}{q(V + I R_s)/R_{sh}} - 1\right) \right] - \left(\frac{V + I R_s}{R_{sh}}\right) \]  

Where, \( I_{ph} \) is a light-generated current or photocurrent, \( I \) is the cell saturation of dark current, \( q \) (= 1.6 ×10−19 C) is an electron charge, \( k \) (= 1.38 ×10−23J/K) is a Boltzmann’s constant, \( Tc \) is the cell’s working temperature, \( A \) is an ideal factor, \( R_{sh} \) is a Shunt resistance, and \( R_s \) is a series resistance of solar cell. The photocurrent mainly depends on the solar insolation and cell’s working temperature, which is described as (2):

\[ I_{ph} = \left[ I_{sc} + K(Tc - T_{ref}) \right] H(2) \]  

Where, \( I_{sc} \) is the cell’s short-circuit current at a 25°C and 1kW/m2, \( K_i \) is the cell’s short-circuit current temperature coefficient, and \( H(2) \) is the solar insolation in kW/m2.

On the other hand, the cell’s saturation current varies with the cell temperature, which is described as:

\[ I_s = I_{rs} \left( \frac{Tc}{T_{ref}} \right)^{3/2} \exp\left[\frac{(qE_g(Tc - T_{ref}) /T_{ref}T_{ck}A)}{kT_{ref}A} \right] \]  

Where, \( I_{rs} \) is the cell’s reverse saturation current at a reference temperature and standard solarradiation.

### MPPT CONTROL ALGORITHM

On the I-V curve, there is a point where the PV cell generates the maximum power, this point always locates at the knee of the curve, and is called maximum power point (MPP). Since the output power of PV cell is related with many parameters such as solar radiation, temperature and load, the output characteristic is nonlinear. It is necessary for the PV system to work at the maximum power point under changing external environment to achieve best performance.

A MPPT is used for extracting the maximum power from the PV cell and transferring that power to the load (6)-(7).

### Perturb & Observe algorithm

The Perturb & Observe algorithm states that when the operating voltage of the PV panel is perturbed by a small increment, if the resulting change in power P is positive, then we are going in the direction of MPP and we keep on perturbing in the same direction. If P is negative, we are going away from the direction of MPP and the sign of perturbation supplied has to be changed.(3)-(4)

### DC/DC CONVERTER

#### A. Reason for Choosing Boost Converter

We chose the classical boost converter to implement the A DC/DC converter serves the purpose of transferring maximum power from the solar PV cell to the load. A DC/DC converter acts as an interface between the load and the PV cell. By changing the duty cycle, the load impedance is varied and matched at the point of the peak power with the source, so as to transfer the maximum power.

![Figure 3. Power graph of P&O algorithm](image1)

![Figure 4. Flowchart of P&O Method](image2)
Figure 5 shows the topology of a Boost converter. For this converter, power flow is controlled by means of the on/off duty cycle of the switching transistor. When the switch is On for Ton seconds, current flows through the inductor in clockwise, and energy Vi I1 Toff is stored.

A DC/DC converter serves the purpose of transferring maximum power from the solar PV cell to the load. A DC/DC converter acts as an interface between the load and the PV cell. By changing the duty cycle, the load impedance is varied and matched at the point of the peak power with the source, so as to transfer the maximum power. When the switch is Off for Toff seconds, current will be reduced for increasing impedance. The only path of the inductor current is through diode D to the capacitor C and load R. The polarity of inductor will change. And the energy accumulated in the inductor during the On-State will be released,

\[(V_c-V_i)I_1t_{off}\]
\[V_i I_1 t_{on} = (V_c - V_i) I_1 t_{off}\]

we have

\[V_c = \frac{t_{off}}{t_{on} + t_{off}} V_i = \frac{T}{t_{off}} V_i\]

Where D is the duty cycle. It represents the fraction of the commutation period T during which the switch is On. Since, the output voltage is always higher than the source voltage.

Figure 6. Simulation Model for DC/DC converter
DC/AC INVERTER

The DC/AC Inverter is used to regulate the output voltage of DC/DC converter and connects the PV cell with DC/DC converter to the grid. The output voltage is required to be sinusoidal and in phase with the grid voltage. Figure 11 shows the whole PV grid-connected system. The PWM signal can be used to control switches of DC/AC inverter. The frequency of PWM waveform is set as 5 kHz, which can reduce the switching noise, simplify the system design and improve the dynamic performance.

CONCLUSION

Grid connected PV system with MPPT system, it can be concluded that, this model can work well under sudden change of environment temperature or solar radiation. The maximum power of the PV cell is tracked with an adjusted P&O MPPT algorithm based on Boost DC/DC converter. A DC/AC inverter has been used to connect the PV cell to the grid and regulate the output voltage of DC/DC converter. The whole pv grid-connected system is simulated in MATLAB/Simulink. Special situations such as sudden change of temperature and solar radiation have been simulated and analyzed.
