

# Arabic Sentiment Analysis approaches: An analytical survey

Gehad S. Kaseb, Mona F. Ahmed

**Abstract**— Web 2.0 has contributed tremendously towards the rapid growth of web contents. People are motivated to develop a system that can identify and classify opinions which are represented in an electronic text. Because of its valuable return in many fields as e-commerce, politics, tourism, etc., Sentiment Analysis (SA) is one of the most active research areas in Natural Language Processing (NLP). Most research efforts in the area of opinion mining deal with English text and little work is done with Arabic text. This paper provides a summarization of the work done in Arabic SA. The paper also presents some challenges and open issues that need to be addressed and explored in more depth in order to improve this field.

**Index Terms**— Opinion Mining, Sentiment Analysis, NLP, Classification, Machine learning, Lexicon.

## 1 INTRODUCTION

Nowadays, the web has become a read and write platform where users are no longer consumers of information but producers of it as well. User-generated content written in natural language with unstructured free text is becoming an integral part of the web mainly because of the dramatic increase of social network web sites, video sharing websites, online news, online reviews sites, online forums and blogs. Because of this proliferation of user-generated content, web content mining is gaining considerable attention due to its importance for many businesses, governmental agencies and institutions.

The Arabic language is a collection of different variants where there is only one formal written standard variant in the media and education through the Arab world [33]. This variant is called Modern Standard Arabic (MSA), while others are called Arabic dialects. There is a high degree of difference between MSA and Arabic dialects. One interesting fact is that the MSA is not of any Arab's native languages.

MSA is the official language of the Arab world and it is syntactically, morphologically, and phonologically based on classical Arabic [33]. Classical Arabic is the language of the Qur'an (Islam's Holy Book) while Arabic dialects are true native language forms, they are used in informal daily communication and they are not taught in schools or standardized [33]. In contrast to dialects, MSA is usually written not spoken. Arabic dialects are poorly related to classical Arabic. There are many Arabic dialects and they are different in many aspects. One way for dividing Arab dialects is based on the geographic aspect [33] as follows:

- The most common dialect is Egyptian Arabic, which covers the Nile valley (Egypt and Sudan)

- Levantine Arabic covers the dialects of Syria, Lebanon, Jordan, Palestine and Israel.
- Gulf Arabic includes the dialects of Gulf countries (United Arab Emirates, Saudi Arabia, etc.).
- Maghrebi (North African) Arabic which cover dialects of Algeria, Tunisia, and Morocco.
- Iraqi Arabic covers Iraq and combines elements of Levantine and Gulf dialects.
- Yemenite Arabic.

Each dialect group is completely linguistically homogeneous. Sentiment Analysis (SA) is the study of people's comments, reviews and opinions about a specific object such as an event, an item, a topic, a news feed, a mobile application, or individuals. Sentiment Classification (SC) approaches can be grouped into three main categories: lexicon-based, Machine Learning (ML) and Hybrid approaches. Lexicon based approaches are unsupervised approaches that depend on external lexica to classify sentiments. ML approaches, are mainly supervised approaches that rely on the existence of labeled training documents/phrases. The main classifiers used in ML are Support Vector Machines (SVM), Naïve Bayesian (NB), Decision Trees (DT), K-Nearest Neighbor (KNN), Multinomial Naive Bayes (MNB), Bernoulli Naive Bayes (BNB), and Stochastic Gradient Descent (SGD). Hybrid approaches are those that combine lexicon and ML techniques.

According to the literature, only little work has been carried out on Arabic language SA. Arabic language is a semitic language with rich morphology. Classical, Modern Standard Arabic (MSA), and colloquial are the three main variants of Arabic. Arabic is the fifth most widely used language in the world, and is the first language of more than 422 million people. The Arabic language is written from right to left and consists of 28 letters with no upper or lower cases.

The field of Arabic SA has been receiving a lot of attention since its rather shy start a decade ago. Recently, many teams have been making significant contributions to this field. The interested reader is referred to the following surveys [1], [2], [35] and [12] to learn more about the work in this field.

Only a few survey papers can be found in the literature summarizing recent research in the field of Arabic SA. The authors of [12] provide a comprehensive survey of existing lex-

- Gehad S. Kaseb is currently pursuing master's degree in Computer Engineering at Cairo University, Egypt, PH-0201141213594. E-mail: [Gehad.Kaseb@gmail.com](mailto:Gehad.Kaseb@gmail.com)
- Mona F. Ahmed is Assistant professor in Computer Engineering at Cairo University, Egypt, Email: [Mona\\_Farouk@eng.cu.edu.eg](mailto:Mona_Farouk@eng.cu.edu.eg)

icon, machine learning, and hybrid sentiment classification techniques for Arabic language. Thirty-two papers were surveyed.

The authors of [1] and [2] provide surveys of the relatively few references detailing the different methods for building Arabic subjectivity and SA systems from the years 2010-2013 and 2004-2012 respectively, at a time when research on Arabic SA was so limited. The authors of [3] present a survey of Arabic tweets SA referencing only nine methodologies. The authors of [35] provide an extended analytical study in SA.

The remainder of this paper is organized as follows: section 2 explores SA related works. Section 3 presents a discussion with the summarization of the presented work. Section 4 shows Arabic language challenges. Section 5 presents concluding remarks. Section 6 discusses the future plans in this field.

## 2 RELATED WORK

In order to spot new research advancement in SA of Arabic, an exhaustive search process was performed using the Scopus databases. A total of 133 papers were found since 2003. The number of research on Arabic SA has witnessed an enormous increase in recent years; it reached 39 papers in 2016 up to this date. Figure 1 exhibits this increase.

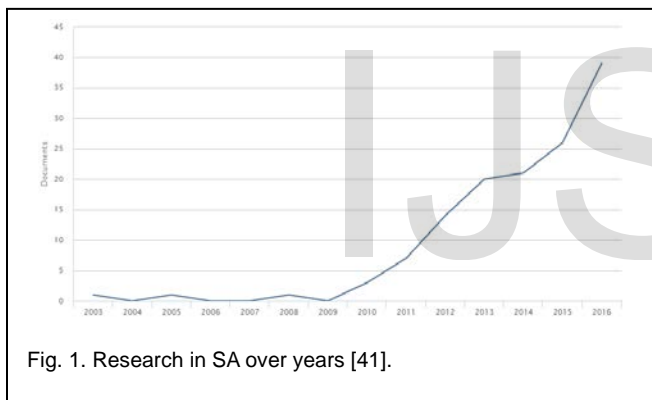

Fig. 1. Research in SA over years [41].

There are 27 papers for Jordan, 18 for Egypt and 17 for Saudi Arabia and USA. Figure 2 shows paper statistics per country

Fig. 2. Research in SA country [41].

Figure 3 shows paper statistics per publishing document type.

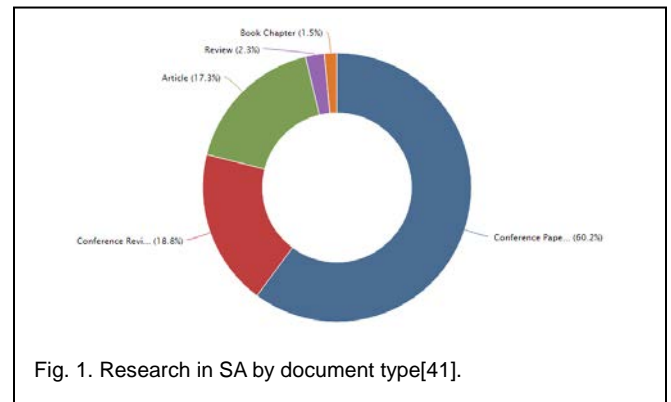

Fig. 1. Research in SA by document type[41].

## 3 SENTIMENT ANALYSIS DISCUSSION

It is obvious from the literature that, in contrast to the work in English language, work in Arabic SA is very little, with a lot of potential techniques and approaches still not applied yet. The following tables summarize work - to the best of our knowledge- related to Arabic SA published starting from 2011 with more concentration on much more recent work published in 2016. For simplicity the summary of the analyzed work is formulated in a table focusing on certain important parameters written in the following order:

Work reference.

- The publishing year of this work.
- The sentiment analysis level which can be document or sentence level
- The used Language and also the used dialects
- Whether the article is domain-oriented or not.
- The used polarities; the majority of papers used positive and negative polarities, however, some papers worked with neutral class or objective class and others worked with 5-star rating system.
- The kind of preprocessing and filtering used.
- The type of classification which may be ML, lexicon-based or hybrid.
- The used software if mentioned.
- The context and the dataset size used in experiments.
- The strengths of the applied methodology; it may be the authors opinion of the referenced work or this survey point of view.
- The weaknesses of the applied methodology; it is this survey own point of view.
- The results, the majority of papers use accuracy, however some papers use precision and recall.
- The contributions of this work in the field.
- The suggested future work.

Any empty cells are unknown information for this work.

The author in [5] proposed a hybrid approach that com-

bins three methods.

(OCA) and another one which is the English version of OCA (EVOCA)

TABLE 1  
SUMMARIZATION OF [5]

TABLE 2  
SUMMARIZATION OF [8]

<b>Paper</b>	[5]
<b>Publishing year</b>	2011
<b>SA Level</b>	Document level
<b>The Language</b>	Arabic
<b>Domain Oriented</b>	Yes ( Multi-domain: Education, Sports, and Politics)
<b>Polarity</b>	Positive & Negative
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Stripping out the HTML tags and non-textual contents</li> <li>- Separating the documents into posts and converting each post into a single file.</li> <li>- Normalizing some alphabets</li> <li>- Removing some repeated letters</li> <li>- Correcting some of the wrong spelling words</li> <li>- Tokenization</li> <li>- Removing stop words</li> <li>- Applying Arabic light stemmer</li> <li>- Using Term Frequency–Inverse Document Frequency (TF-IDF) weight</li> <li>- Removing some terms with a low frequency of occurrence.</li> </ul>
<b>The type of classification</b>	lexicon-based opinion classifier, then Maximum entropy method and finally k-nearest method
<b>Software Used</b>	SentiStrength [24]
<b>The context and the dataset size</b>	Total of 1143 posts which contain 8793 Arabic statements with average of 7.7 statements in each post.
<b>Strengths</b>	The accuracy almost improved from 50% using one method, 60% using two method and 80% using three methods which is a satisfactory performance especially for complex language such as Arabic.
<b>Weaknesses</b>	No Arabic-specific features
<b>Results</b>	Accuracy = 80.29%
<b>Contributions</b>	A combined approach that automatically extracts opinions from Arabic documents that consists of three successive methods; At the beginning, lexicon based method is used to classify as much documents as possible. The resultant classified documents are used as training set for the maximum entropy method which subsequently classifies some other documents. Finally, k-nearest method used the classified documents from lexicon based method and maximum entropy as training set and classifies the rest of the document
<b>Future Work</b>	The experimental results further show that recall and precision of positive documents are better than the negative one. That means further studies should be done for mining of negation of Arabic statements. Also, in the future, it is planned to extend the work to be able to extract features from Arabic opinioned statements

<b>Paper</b>	[8]
<b>Publishing year</b>	2011
<b>SA Level</b>	Sentence Level
<b>The Language</b>	Arabic and English
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive & Negative
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Tokenization</li> <li>- Removing Arabic stop words</li> <li>- Stemming</li> <li>- Filtering tokens whose length was less than two characters.</li> </ul>
<b>The type of classification</b>	SVM, NB using unigrams TF-IDF has been used as a weighting scheme.
<b>Software Used</b>	Rapid Miner [21], PROMT [34] as an online translation
<b>The context and the dataset size</b>	OCA contains 500 reviews in Arabic EVOCA contains 500 reviews in English <ul style="list-style-type: none"> <li>- 250 positive reviews for each corpus.</li> <li>- 250 negative reviews for each corpus.</li> </ul>
<b>Strengths</b>	After accomplishing several experiments using different n-grams models, the obtained results with bi-grams and trigrams were very similar to unigrams. With regard to the machine learning algorithm, it is clear that SVM works better in all cases. In all cases the stemming process gets worse results except when using SVM on the EVOCA corpus. So for the OCA corpus, removing stemmer always improves the results
<b>Weaknesses</b>	Using translation system for building EVOCA; so it's not real reviews
<b>Results</b>	Results with SVM: OCA without stem P= 8699, R=9480 & F1=9073 EVOCA with stem P=9007, R=8680 & F1=8840
<b>Contributions</b>	Presenting OCA and EOCA which are freely available for the research
<b>Future Work</b>	

The authors in [8] presented Opinion Corpus for Arabic

The authors of [16] presented SAMAR, a system for Subjectivity and Sentiment Analysis (SSA) for Arabic social media genres.

The authors in [4] used statistical ML with term frequency to select features, and then applied SVM and NB classifiers.

TABLE 3  
SUMMARIZATION OF [16]

<b>Paper</b>	[16]
<b>Publishing year</b>	2012
<b>SA Level</b>	Sentence
<b>The Language</b>	Arabic (MSA and Dialect Arabic (DA))
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive, Negative and Neutral
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Tokenization (TOK)</li> <li>- Lemmatization (LEM)</li> </ul>
<b>The type of classification</b>	A lexicon manually created of 3982 adjectives. Using SVM light [31]. A two-stage classification approach; first OBJ or SBJ; second Positive or Negative Features used: POS tagging (the reduced tagsets RTS and the extended reduced tag set ERTS), UNIQUE (Q) feature, Gender, UserID, Document ID, Polarity Lexicon (PL)
<b>Software Used</b>	AMIRA [26] for processing of MSA
<b>The context and the dataset size</b>	DARDASHA (DAR): 2798 chat from maktoob TAGREED (TGRD): 3015 Arabic tweets TAHRIR (THR): 3008 MSA Wikipedia Talk Pages MONTADA (MONT): 3097 forum MSA and DA
<b>Strengths</b>	<ul style="list-style-type: none"> <li>- Tackling a number of research questions</li> <li>- Exploiting data from four different social media genres.</li> </ul>
<b>Weaknesses</b>	<ul style="list-style-type: none"> <li>- Disregarding the neutral class</li> </ul>
<b>Results</b>	Best results in this case <ul style="list-style-type: none"> <li>- DAR dataset: For Objective/Subjective classification accuracy = 95.83 using TOK+ERTS+PL+Q3 For Positive/Negative classification accuracy = 71.28 using LEM+PL+GEN</li> <li>- TGRID dataset: For Objective/Subjective classification accuracy = 72.52 using LEM+ERTS+PL For Positive/Negative classification accuracy = 65.87 using TOK+ERTS+PL+GEN+LV+UID</li> <li>- THR dataset: For Objective/Subjective classification accuracy = 83.33 using TOK+ERTS +PL+Q3 For Positive/Negative classification accuracy = 67.44 using TOK+PL+GEN+UID</li> <li>- MONT dataset: For Objective/Subjective classification accuracy = 84.19 using LEM+RTS+PL+Q3 For Positive/Negative classification accuracy = 81.36 using TOK+PL+Q3</li> </ul>
<b>Contributions</b>	Arriving at these conclusions: <ul style="list-style-type: none"> <li>- Linear kernels yield the best performance.</li> <li>- Adding POS information improves accuracy and F score in most cases</li> <li>- RTS outperforms ERTS with TOK, and the opposite with LEM where ERTS outperforms RTS, however, overall TOK+RTS yields the highest performance of 91.49% F score on subjectivity classification for the DAR dataset.</li> <li>- For the TGRD and THR data sets, TOK+ERTS are equal to or outperform the other conditions on subjectivity classification.</li> </ul>
<b>Future Work</b>	Carring out a detailed error analysis of SAMAR in an attempt to improve its performance.

TABLE 4  
SUMMARIZATION OF [4]

<b>Paper Reference</b>	[4]
<b>Publishing year</b>	2012
<b>SA Level</b>	Sentence level
<b>The Language</b>	Arabic (Egyptian dialect)
<b>Domain Oriented</b>	Yes
<b>Polarity</b>	Positive and Negative
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Removing the user-names</li> <li>- Removing the pictures</li> <li>- Removing the hash tags</li> <li>- Removing the URLs</li> <li>- Removing all non-Arabic words.</li> <li>- Removing stop-words</li> </ul>
<b>The type of classification</b>	The feature vectors applied to the classifier contained the term frequency, as using statistical machine learning. First the process starts by extracting all the unigrams and bigrams in the corpus that exceed certain threshold. Ignoring negation for simplicity in experiments
<b>Software Used</b>	WEKA [30]
<b>The context and the dataset size</b>	1000 tweets consisting of <ul style="list-style-type: none"> <li>- 500 positive and 500 negative.</li> </ul>
<b>Strengths</b>	Developing Egyptian stop words list
<b>Weaknesses</b>	<ul style="list-style-type: none"> <li>- Using small size dataset</li> <li>- Ignoring negation</li> </ul>
<b>Results</b>	Get maximum result using SVM, unigrams only, after removing stop-words <ul style="list-style-type: none"> <li>- Accuracy = 0.726</li> <li>- Precision = 0.728</li> <li>- Recall = 0.726</li> <li>- F-Measure = 0.725</li> </ul>
<b>Contributions</b>	Arriving at these conclusions: <ul style="list-style-type: none"> <li>- SVM produces more accurate results than the NB.</li> <li>- Regarding the n-gram model, bigram model didn't enhance the results using the unigram model.</li> </ul>
<b>Future Work</b>	Improving corpus using techniques such as enlarging or fine-grained annotation Adding some stylistics features, in addition to considering adding some semantic features thus creating a hybrid approach that combines both the ML and SO approaches. Re-tweeting gives a misleading boosting to the weight of the terms in the sentence. The problem of opinion spamming or untruthful opinions could affect the accuracy Building a more comprehensive list of all the positive and negative sentiment words for the Egyptian dialect also negations and valence shifters. Neutral sentiment tweets has to be considered as in real world applications neutral tweets cannot be ignored.

The authors of [13] conducted a study to compare the effectiveness of two free online SA tools for Arabic comments.

TABLE 5  
SUMMARIZATION OF [13]

<b>Paper</b>	[13]
<b>Publishing year</b>	2013
<b>SA Level</b>	Sentence
<b>The Language</b>	Arabic and English
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive and Negative
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Removing spammed and noisy comments.</li> <li>- Removing duplicate comments and reviews</li> </ul>
<b>The type of classification</b>	Building three dictionaries Arabic, English, Emotions. <ul style="list-style-type: none"> <li>- The English dictionary has 3,392 words/phrases of which 947 positive, 1100 negative, and 1,345 neutral.</li> <li>- The Arabic dictionary has 1,159 words/phrases of which 427 positive, 306 negative, and 426 neutral.</li> <li>- The Emoticons dictionary has 204 Emoticons of which 71 positive, 70 negative, and 99 neutral.</li> </ul> Using NB, SVM, and KNN
<b>Software Used</b>	SocialMention [27] and Twenzd [28]
<b>The context and the dataset size</b>	4,050 English/Arabic comments and reviews generated by the users of social network sites.
<b>Strengths</b>	The results indicate that SocialMention is more effective than its counterpart (Twenzd) to identify the polarity of each entry in the collected dataset. The conducted results showed that the Naïve Bayes algorithm yields the best results for both SocialMention and Twenzd tools.
<b>Weaknesses</b>	Using a small dataset compared to dictionaries.
<b>Results</b>	Using Naïve Bayes algorithm, the Twenzd tool yields an accuracy of 45.3% while the SocialMention tool yields an accuracy of 66.2%. Using SVM algorithm yields an accuracy of 43.3% for the Twenzd tool, and an accuracy of 65.4% for the SocialMention tool Using K-NN algorithm when K = 1 yields an accuracy of 44.4% for the Twenzd tool, and an accuracy of 62.5% for the SocialMention tool.
<b>Contributions</b>	Evaluating the two free online SA tools, by finding the classification accuracy of each tool and developing dictionary-based classifier. Building three dictionaries Arabic, English, Emotions
<b>Future Work</b>	Using a larger dataset, besides testing more free online SA tools.

TABLE 6  
SUMMARIZATION OF [36]

<b>Paper</b>	[36]
<b>Publishing year</b>	2013
<b>SA Level</b>	Sentence level
<b>The Language</b>	Arabic (Egyptian dialects)
<b>Domain Oriented</b>	Yes
<b>Polarity</b>	Supportive 'y', Attacking 'n', and Neutral 'u'.
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Removing stop words from the comments returning the most important words.</li> <li>- Removing very long comments with number of words -after stop words removal- more than 150 words as about 80% of very long comments in most cases are advertisements for pages on Facebook</li> <li>- Removing the redundant comments; If two comments have similarity value equal to or more than a threshold (0.4), removing the shortest one.</li> <li>- Removing special characters like #, @, !, % and others.</li> <li>- Removing the redundant letters</li> <li>- Segmentation of comments into words, spaces, commas, parenthesis and new line for identifying words .</li> </ul>
<b>The type of classification</b>	<ul style="list-style-type: none"> <li>- Classifiers: Using SVM, NB and DT classifiers</li> <li>- Feature extractors.</li> </ul> Three groups of features: 1) Common Words between Post and Comments Features Feature 1: Number of Words in Post Only Feature 2: Number of Words in Comment Only Feature 3: Number of Words Common between Post and Comment 2) All Words in Posts and Comments Features the union of all words in the posts and comments. Each word (feature) takes one of the four values: "C" if the word is not in the post or the comment "M" if the word is in the post only "N" if the word is in the comment only "H" if the word is in both of the post and the comment 3) Negation and Relevance Features Feature 1: Number of Negation Words in Post Feature 2: Number of Negation Words in Comment Feature 3: Relevance with Post
<b>Software Used</b>	WEKA
<b>The context and the dataset size</b>	2400 comments collected from 220 facebook posts 800 neutral, 800 supportive, and 800 attacking.
<b>Strengths</b>	Comparing different machine learning algorithms with different features.
<b>Weaknesses</b>	Counting only five different negation words, whereas there are many more than these
<b>Results</b>	Naïve Bayes precision and recall = 59.9%. Decision Tree precision and recall = 69.4% SVM precision and recall = 73.4%.
<b>Contributions</b>	Arriving at these conclusions: <ul style="list-style-type: none"> <li>- SVM gives the best results</li> <li>- Adding negation words and similarity features for all words in posts and comments gives the best performance.</li> </ul>
<b>Future Work</b>	

The authors of [36] designed a sentiment analyzer system

The authors of [6] compared the lexicon-based and supervised approaches

TABLE 7  
SUMMARIZATION OF [6]

<b>Paper</b>	[6]
<b>Publishing year</b>	2013
<b>SA Level</b>	Sentence Level
<b>The Language</b>	Arabic (MSA and the Jordanian dialect)
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive & Negative
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Correcting misspellings</li> <li>- Removing the repeated letters</li> <li>- Using naive algorithm for repeated letters which simply counts the number of letters in each word. If the number exceeds 5, then it eliminates the repeated letters and looks it up in the MS Word dictionary.</li> <li>- Removing all stop-words.</li> <li>- Normalization process for the letters.</li> </ul>
<b>The type of classification</b>	<p>For supervised, SVM, NB, DT, and KNN where K=9. Use lexicon with 3479 words consisting of 1262 positive words and 2217 negative ones.</p> <p>Unigram technique for feature extraction</p> <pre> INPUT: Text File (contains reviews) T, The sentiment lexicon L. OUTPUT: S<sub>i</sub> = {P, Ng, or N}, where P: Positive, Ng: Negative, N: Neutral. INITIALIZATION: Sum = 0, where sum: accumulates the polarity of all tokens t<sub>i,100</sub> in T. Begin 1. For each t<sub>i</sub> ∈ T do 2. Search for t<sub>i</sub> in L 3. If t<sub>i</sub> ∈ L then 4. Sum ← Sum + A<sub>t<sub>i</sub></sub> 5. End If 6. End For 7. If Sum &gt; 0 then 8. S<sub>i</sub> = P 9. Else If Sum &lt; 0 then 10. S<sub>i</sub> = Ng 11. Else 12. S<sub>i</sub> = N 13. End If End                 </pre> <p>Fig. 4. Used Algorithm in [6].</p>
<b>Software Used</b>	MS Word dictionary [22] as a reference for misspelling correction and selecting the first word suggested by it automatically. Khoja stemmer tool [23] as a reference for a list of Arabic stop-words SentiStrength [24] as a reference for 300 seed words translated for lexicon RapidMiner software [21] for supervised experiments
<b>The context and the dataset size</b>	2000 labeled tweets <ul style="list-style-type: none"> <li>- 1000 positive tweets</li> <li>- 1000 negative tweets</li> </ul>
<b>Strengths</b>	In KNN, using K=9 gives the best accuracy than K= 1, 2, 3 and 4 SVM and NB have better accuracy than other classifiers when it comes to text classification. Light-stemming gives better results than other stemming techniques The bigger the lexicon is, the better the results are.
<b>Weaknesses</b>	No neutral class, small lexicon size and no intensive handling for Arabic dialects
<b>Results</b>	<ul style="list-style-type: none"> <li>- In corpus-based accuracy = 87.2%</li> <li>- In lexicon-based accuracy = 59.6%</li> </ul>
<b>Contributions</b>	Building a manually annotated dataset Showing the detailed steps of building the lexicon
<b>Future Work</b>	Enlarging the dataset along with adding a third polarity case (neutral class) Adding strength to the polarity of words that could vary between -5 to +5, which may end up with more accurate outcomes The sarcasm in some tweets always leads to misinterpretation and consequently a wrong polarity classification. Hence, taking into consideration sarcasm absolutely will results in higher accuracy

The authors of [11] developed a framework that determines the polarity of Arabic Tweets.

TABLE 8

<b>The Language</b>	Arabic (MSA/ Jordanian dialect/ Arabizi)
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive, Negative and Neutral
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Tokenization</li> <li>- Normalization</li> <li>- Filtering Arabic stop-words</li> <li>- Stemming</li> </ul> <p>Extensions to Rapidminer:</p> <ul style="list-style-type: none"> <li>- Emoticons Converter</li> <li>- Repetitions Remover</li> <li>- Negation Detection</li> <li>- Dialect to MSA convertor</li> <li>- Links Remover</li> <li>- Mentions Remover</li> </ul>
<b>The type of classification</b>	Jordanian dialect to MSA parallel dictionary 300 words Negation Dictionary, Arabizi Dictionary SVM, NB, and K-NN
<b>Software Used</b>	Rapidminer [21], MS word [22]
<b>The context and the dataset size</b>	350,000 Arabic tweets 25000+ rated tweets for the training dataset.
<b>Strengths</b>	Building three dictionaries
<b>Weaknesses</b>	The dataset and the dialect dictionary are of small size
<b>Results</b>	SVM accuracy = 71.68% when both stopwords filter and stemming were disabled
<b>Contributions</b>	Handling negations, Arabizi and Arabic dialects.
<b>Future Work</b>	Expanding the dictionaries and solving the memory issue which is inherent in Rapidminer.

The authors in [7] dealt with SA in Arabic reviews from a machine learning perspective.

TABLE 9  
SUMMARIZATION OF [7]

<b>Paper</b>	[7]
<b>Publishing year</b>	2014
<b>SA Level</b>	Sentence
<b>The Language</b>	Arabic
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive and Negative
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Tokenization</li> <li>- Stemming (Arabic)</li> <li>- Filtering Stop-words (Arabic)</li> <li>- Generating n-Grams (Terms) operators n=2</li> </ul>
<b>The type of classification</b>	Using NB, SVM and KNN (at K=10) classifiers
<b>Software Used</b>	RapidMiner [21], crowdsourcing tool for annotating dataset
<b>The context and the dataset size</b>	2591 Tweet/Comment <ul style="list-style-type: none"> <li>- 1073 Positive and 1518 Negative</li> </ul>
<b>Strengths</b>	Utilizing crowdsourcing to label the used dataset
<b>Weaknesses</b>	Using small dataset
<b>Results</b>	SVM achieve the best precision = 75.25. KNN achieve the best recall = 69.04
<b>Contributions</b>	Arriving at this conclusion: SVM gives the highest precision while KNN gives the highest Recall.
<b>Future Work</b>	Increasing the datasets. Semi-supervised learning techniques could be used in Arabic SA text as these techniques have been applied successfully to other languages.

The authors in [37] built a collected dataset of Arabic twitter corpora for SSA

TABLE 10  
SUMMARIZATION OF [37]

<b>Paper</b>	[37]
<b>Publishing year</b>	2014
<b>SA Level</b>	Sentence Level
<b>The Language</b>	Arabic
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive, Negative and Neutral
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Normalization</li> <li>- Removing usemames and digits.</li> <li>- Eliminating Latin characters (i.e. URLs, emails).</li> </ul>
<b>The type of classification</b>	<p>Overview of annotated feature sets</p> <p>Morphological Feature sets: Diacritic, Aspect, Gender, Mood, Person, Part of speech, State, Voice, having morphological analysis.</p> <p>Syntactic Feature sets: n-grams of words, POS, lexemes including Bag of Words (BOW), Bag of lexemes.</p> <p>Semantic Feature sets: Having positive lexicon, Having negative lexicon, Having neutral lexicon, Having negator.</p> <p>Stylistic Feature sets: Having positive emoticon, Having negative emoticon.</p> <p>Social Signals Feature sets: Having consent, Having dazzle, Having laugh, Having regret, Having sigh</p>
<b>Software Used</b>	
<b>The context and the dataset size</b>	Development dataset: This dataset contains 7,503 random multi-dialectal Arabic tweets. Test data: This dataset contains a total of 1,365 instances.
<b>Strengths</b>	Manually labling dataset which increase the accuracy
<b>Weaknesses</b>	No contextual features to detect sarcasm. Significant drop in performance for sentiment analysis which was found out by error analysis to be due to the noise introduced by the emoticon-based labels.
<b>Results</b>	The overall observed agreement is 91.74% and resulting weighted Kappa reached $k = 0.816$ , which indicates reliable annotations
<b>Contributions</b>	Presenting a gold-standard annotated corpus to support SSA of Arabic twitter feeds, the first publicly available corpus for this task which is released via the ELRA repository.
<b>Future Work</b>	

The authors in [9] proposed the Arabic social sentiment analysis dataset (ASTD)

TABLE 11  
SUMMARIZATION OF [9]

<b>Paper</b>	[9]
<b>Publishing year</b>	2015
<b>SA Level</b>	Sentence
<b>The Language</b>	Arabic (MSA and Egyptian)
<b>Domain Oriented</b>	No
<b>Polarity</b>	Objective, subjective positive, subjective negative and subjective neutral.
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Filtering out the non-Arabic tweets</li> <li>- Removing HTML content</li> </ul>
<b>The type of classification</b>	MNB, BNB, SVM, SGD and KNN
<b>Software Used</b>	
<b>The context and the dataset size</b>	10,006 Arabic tweets.
<b>Strengths</b>	SVM is the best classifier so it is a reliable choice.
<b>Weaknesses</b>	The small number of subjective tweets it contains.
<b>Results</b>	Accuracy = 0.691 F1 score = 0.626 for SVM trigram unbalanced TF-IDF
<b>Contributions</b>	Presenting the properties and the statistics of the dataset ASTD
<b>Future Work</b>	Increasing the size of the dataset. Discussing the issue of unbalanced dataset and text classification. Extending the generated method either automatically or manually.

The author of [14] investigated SVM, NB, KNN and DT on Arabic Twitter corpus.

TABLE 12  
SUMMARIZATION OF [14]

<b>Publishing year</b>	2015
<b>SA Level</b>	Sentence Level
<b>The Language</b>	Arabic
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive, Negative and Neutral.
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Removing all the user identifiers.</li> <li>- Removing Arabic function words</li> <li>- Removing pictures.</li> <li>- Removing Arabic stop words</li> <li>- Removing non-Arabic words</li> <li>- Removing digits and punctuation marks.</li> <li>- Normalization some Arabic letters such as Hamza, Alef and Tatweel.</li> </ul>
<b>The type of classification</b>	DT, NB, KNN and SVM
<b>Software Used</b>	Weka [30]
<b>The context and the dataset size</b>	3700 Arabic tweets <ul style="list-style-type: none"> <li>- 1579 Positive</li> <li>- 1374 Negative</li> <li>- 747 Neutral</li> </ul>
<b>Strengths</b>	SVM performed better than all learning methods on three classes but NB excelled SVM on Negative class.
<b>Weaknesses</b>	Neutral class has unacceptable results, this shows that the Neutral class is extremely correlated with other classes.
<b>Results</b>	Precision = 0.727, F1 score = 0.722
<b>Contributions</b>	Arriving at this conclusion: SVM learning method outperformed the KNN, NB and Decision tree learning methods with regard to Recall, Precision and F1 measures.
<b>Future Work</b>	Developing a new stemming method that stems Arabic words because the writers do not write the message based on standard Arabic language that works on traditional stemmer.

The authors of [15] explored Distant Supervision (DS) based on emoticons.

TABLE 13  
SUMMARIZATION OF [15]

<b>Paper</b>	[15]
<b>Publishing year</b>	2015
<b>SA Level</b>	Sentence
<b>The Language</b>	Arabic
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive and Negative.
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Normalization of digits and non-Arabic characters</li> <li>- Removing user-names and links</li> </ul>
<b>The type of classification</b>	DS, SVM
<b>Software Used</b>	
<b>The context and the dataset size</b>	Gold-Standard Dataset Emoticon-Based Queries training Dataset (120,747 data instances) Lexicon-Based annotation training Dataset (18,105 positive, 10,039 negative instances)
<b>Strengths</b>	DS approaches to SSA for Arabic Twitter feeds show significantly higher performance in accuracy and F-score than a fully supervised approach. SVM is the best performing scheme.
<b>Weaknesses</b>	Using DS but not providing improvement over the supervised techniques in the task of Sentiment Analysis
<b>Results</b>	Accuracy = 95.19%
<b>Contributions</b>	The first to explore distant supervision (DS) approaches for automatic SSA classification for Arabic social networks.
<b>Future Work</b>	

The authors of [10] presented a SA system for MSA and Egyptian dialect.

The authors of [18] compared between SVM and NB for po-  
TABLE 14  
SUMMARIZATION OF [10]

<b>Paper</b>	[10]
<b>Publishing year</b>	2015
<b>SA Level</b>	Sentence
<b>The Language</b>	Arabic (MSA and Egyptian dialect)
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive and Negative.
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Removing foreign characters, symbols, numbers, etc.</li> <li>- Removing stop-words</li> <li>- Normalization (unified Arabic characters and removing all diacritics )</li> </ul>
<b>The type of classification</b>	A semi-supervised approach for SA using a high coverage Arabic sentiment words lexicon (400 adjectives collected manually from different websites) which is automatically increased, and Arabic sentiment idioms/saying phrase lexicon (12785 wisdoms and idioms are collected from websites and books) to improve the classification process. Using SVM classifier with linguistically and syntactically influenced features.
<b>Software Used</b>	
<b>The context and the dataset size</b>	2000 Arabic sentiment statements <ul style="list-style-type: none"> <li>- 1000 MSA tweets and Arabic dialect tweets</li> <li>- 1000 microblogs (hotel reservation comments, product reviews, TV program&amp; movie comments)</li> </ul>
<b>Strengths</b>	Exploiting idioms and saying lexicon with a high coverage polarity lexicon has the largest impact on classification accuracy. Also, the automatic expansion of the polarity lexicon yields a great effect on sentiment classification.
<b>Weaknesses</b>	A dataset of small size
<b>Results</b>	Accuracies over 95% in some cases.
<b>Contributions</b>	Employing a number of novels and rich feature sets to handle the valence shifters (negation, intensifiers), questions and suppletion terms and to improve the classification performance. Building two lexicons; Arabic sentiment words lexicon and Arabic sentiment idioms/saying phrase lexicon.
<b>Future Work</b>	

litical Arabic twitter data.

The authors of [20] used Twitter in trading strategy with Mubasher products [25].

TABLE 15  
SUMMARIZATION OF [18]

<b>Paper</b>	[18]

<b>SA Level</b>	Sentence
<b>The Language</b>	Arabic
<b>Domain Oriented</b>	Yes
<b>Polarity</b>	Positive and Negative.
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Tokenization</li> <li>- Normalization</li> <li>- Stemming (light)</li> <li>- Removing non-Arabic characters</li> <li>- Removing Stop words</li> </ul>
<b>The type of classification</b>	SVM and NB Using of TF-IDF
<b>Software Used</b>	WEKA [30]
<b>The context and the dataset size</b>	18278 tweets - 11910 positive and 6368 negative
<b>Strengths</b>	Building a political corpus
<b>Weaknesses</b>	No real addition
<b>Results</b>	SVM get P =.862 and R =.884 and F =.871 NB get P =.925 and R =.921 and F =.922
<b>Contributions</b>	Arriving at this conclusion: The results shows that the NB method is of the highest accuracy and the lowest error rate.
<b>Future Work</b>	Comparing the results obtained from these used classifiers with other classifiers. Comparing the results obtained from light stemmer which is used and Khoja stemmer [23]. Comparing the results obtained from unigram, bigram and trigram.

TABLE 16  
SUMMARIZATION OF [20]

<b>Paper</b>	[20]
<b>Publishing year</b>	2016
<b>SA Level</b>	Sentence
<b>The Language</b>	Arabic
<b>Domain Oriented</b>	
<b>Polarity</b>	Positive, Negative and Neutral
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Replacing some words, such as company codes, percentage sign (%).</li> <li>- Normalization.</li> <li>- Tokenization</li> <li>- Removing stop word</li> <li>- Stemming Light</li> <li>- Filtering token by length 3.</li> </ul>
<b>The type of classification</b>	NB and SVMs TF-IDF and Binary-Term Occurrence.
<b>Software Used</b>	Mubasher software [25], Rapidminer [21], Twitter Data Grabber [38]
<b>The context and the dataset size</b>	1331 Total - 378 Positive, 755 Negative, 198 Neutral
<b>Strengths</b>	The best accuracy was achieved by SVM without N-Gram feature .On the other hand, the best accuracy was completed by Naive-Bayes when the N-Gram feature is involved.
<b>Weaknesses</b>	Dataset of small size
<b>Results</b>	Accuracy = 89.68% for SVM using TF-IDF
<b>Contributions</b>	Classifying Arabic sentiments toward Mubasher products through different algorithms
<b>Future Work</b>	Extracting technical features aspects of Mubasher products such as Human Computer Interaction (HCI).

The authors of [19] used supervised learning for tweets written in Arabizi.

TABLE 17  
SUMMARIZATION OF [19]

<b>Paper</b>	[19]
<b>Publishing year</b>	2016
<b>SA Level</b>	Sentence level
<b>The Language</b>	Arabic (Arabizi)
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive, Negative and Neutral
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Tokenizing tweets into words</li> <li>- Mapping every emoticon into its corresponding word</li> <li>- Converting tweets written in Arabizi into tweets written in Arabic using the built-in rule-based converter.</li> <li>- Removing stop-words.</li> <li>- Calculating the weight of every token using the Binary Model.</li> </ul>
<b>The type of classification</b>	NB and SVM
<b>Software Used</b>	Crowdsourcing was used to label the dataset.
<b>The context and the dataset size</b>	Arabizi dataset consists of 3206 tweets. - 1803 positive, 831 negative, 572 neutral
<b>Strengths</b>	SVM accuracies are higher than NB accuracies. Removal of stop-words and mapping emoticons to their corresponding words did not greatly improve the accuracies for Arabizi data. Eliminating neutral tweets at early stage in the classification improves precision for both NB and SVM. However, Recall values fluctuated, sometimes they got improved; on other times they did not improve
<b>Weaknesses</b>	Dataset of small size
<b>Results</b>	SVM (before removing Neutral class) <ul style="list-style-type: none"> <li>- with filter Recall for positive class = .831 for negative class =.377</li> <li>- without filter Recall for positive class = .814 for negative class =.386</li> </ul> SVM (after removing Neutral class) <ul style="list-style-type: none"> <li>- with filter Recall for positive class = .869 for negative class =.367</li> <li>- without filter Recall for positive class = .862 for negative class =.404</li> </ul>
<b>Contributions</b>	The first to provide this treatment for Arabizi.
<b>Future Work</b>	

The authors of [39] built a Saudi twitter corpus for SA.

The authors of [17] showed the use of divide-and-conquer hierarchical structure of classifiers

TABLE 18  
SUMMARIZATION OF [17]

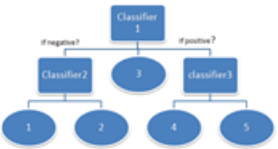

<b>Paper</b>	[17]
<b>Publishing year</b>	2016
<b>SA Level</b>	Sentence
<b>The Language</b>	Arabic (MSA and colloquial Arabic)
<b>Domain Oriented</b>	No
<b>Polarity</b>	1,2,3,4,5 rating classes
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Bag-Of-Word using StringToWordsVector</li> <li>- Tokenization using WordTokenizer</li> <li>- Removing stop words</li> <li>- No stemmers</li> </ul>
<b>The type of classification</b>	<p>SVM, NB, KNN and Decision Tree (DT). Construct different hierarchical classifier trees.</p>  <p>Fig. 5. The 2-level hierarchical classifier.</p>  <p>Fig. 6. The 4-level hierarchical classifier.</p>
<b>Software Used</b>	Weka [30]
<b>The context and the dataset size</b>	<p>LABR dataset: consists of 63,257 book reviews which have a rating (1 to 5)</p> <ul style="list-style-type: none"> <li>- Class 1 contains 2,939 reviews.</li> <li>- Class 2 contains 5,285 reviews.</li> <li>- Class 3 contains 12,201 reviews.</li> <li>- Class 4 contains 19,054 reviews.</li> <li>- Class 5 contains 23,778 reviews.</li> </ul>
<b>Strengths</b>	Hierarchical classifiers give significant improvements (of more than 50% in certain cases) over flat classifiers.
<b>Weaknesses</b>	No stemmers were used during preprocessing. Using LABR dataset only for the experiments.
<b>Results</b>	<p>Accuracies</p> <p>SVM ( Flat= 45.7%, 2-level= 45.2%, 4-level= 47.4%)  DT ( Flat= 40.2%, 2-level= 43.9% , 4-level= 47.6%)  NB ( Flat= 38.2% , 2-level= 39.9% 4-level= 48.9%)  KNN ( Flat= 38.6% , 2-level= 46.2%, 4-level= 57.8%)</p>
<b>Contributions</b>	Showing how the use of this divide-and-conquer hierarchical structure of classifiers can generate better results than the use of existing flat classifiers for the Multi-Way Sentiment Analysis (MWSA) problem (5 star scoring).
<b>Future Work</b>	

TABLE 19  
SUMMARIZATION OF [39]

<b>Paper</b>	[39]
<b>Publishing year</b>	2016
<b>SA Level</b>	Sentence
<b>The Language</b>	Arabic (Saudi dialect)
<b>Domain Oriented</b>	No
<b>Polarity</b>	Positive, Negative and Neutral.
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Removing duplicate tweets before and after the cleaning process</li> <li>- Removing links, hashtags and non Arabic words</li> </ul>
<b>The type of classification</b>	<pre> begin   Prepare set of three application accounts on twitter to be used as a way of   authenticating   while Authenticated by the account that has available rate limit do     for each hashtag in Hashtags do       if current account rate limit is reached then         break       end       Use twitter api to search for term (hashtag)       Save the collected tweets for the current hashtag     end   end end </pre> <p>Fig. 1 Pseudo Code for collecting tweets using twitter API used in this work</p>
<b>Software Used</b>	<p>Ruby-on-Rails (RoR)  Twitter API to collect data.</p>
<b>The context and the dataset size</b>	<p>4700 tweets</p> <ul style="list-style-type: none"> <li>- First annotator: 1830 positive, 1991 negative and 904 neutral</li> <li>- Second annotator: 2100 positive, 2016 negative and 584 neutral</li> </ul>
<b>Strengths</b>	Building a free public corpus
<b>Weaknesses</b>	Dataset of small size
<b>Results</b>	Saudi dialect corpus with (Kappa = 0.807)
<b>Contributions</b>	Presenting an annotated publicly available corpus that applied SA to Twitter content.
<b>Future Work</b>	<p>Extending this corpus  Generating a large scale lexicon for Saudi dialect  Building a comprehensive SA system for Saudi dialect using big data technique.</p>

The authors of [40] built a mutli-dialects Arabic corpus.

TABLE 20  
SUMMARIZATION OF [40]

<b>Paper</b>	[5]
<b>Publishing year</b>	2011
<b>SA Level</b>	Document level
<b>The Language</b>	Arabic
<b>Domain Oriented</b>	Yes (Multi-domain: Education, Sports, and Politics)
<b>Polarity</b>	Positive & Negative
<b>Preprocessing &amp; Filtering</b>	<ul style="list-style-type: none"> <li>- Stripping out the HTML tags and non-textual contents</li> <li>- Separating the documents into posts and Converting each post into a single file.</li> <li>- Normalizing some alphabets</li> <li>- Removing some repeated letters</li> <li>- Correcting some of the wrong spelling words</li> <li>- Tokenization</li> <li>- Removing stop words</li> <li>- Applying Arabic light stemmer</li> <li>- Using Term Frequency-Inverse Document Frequency (TF-IDF) weight</li> <li>- Removing some terms with a low frequency of occurrence.</li> </ul>
<b>The type of classification</b>	lexicon-based opinion classifier, then Maximum entropy method and finally k-nearest method
<b>Software Used</b>	SentiStrength [24]
<b>The context and the dataset size</b>	Total of 1143 posts which contain 8793 Arabic statements with average of 7.7 statements in each post.
<b>Strengths</b>	The accuracy almost improved from 50% using one method, 60% using two method and 80% using three methods which is a satisfactory performance especially for complex language such as Arabic.
<b>Weaknesses</b>	No Arabic-specific features
<b>Results</b>	Accuracy = 80.29%
<b>Contributions</b>	A combined approach that automatically extracts opinions from Arabic documents that consists of three successive methods; At the beginning, lexicon based method is used to classify as much documents as possible. The resultant classified documents are used as training set for the maximum entropy method which subsequently classifies some other documents. Finally, k-nearest method used the classified documents from lexicon based method and maximum entropy as training set and classifies the rest of the document
<b>Future Work</b>	The experimental results further show that recall and precision of positive documents are better than the negative one. That means further studies should be done for mining of negation of Arabic statements. Also, in the future, it is planned to extend the work to be able to extract features from Arabic opinioned statements

#### 4 ARABIC LANGUAGE CHALLENGES

Arabic language is complex to analyze because of the special properties it has. The following points will explain the challenges in Arabic language:

(1) The limited work in this area when compared to other languages especially English. Arabic online resources are increasing nowadays, but they are still comparatively very small.

(2) Morphological complexities and dialectal varieties of the Arabic language which require advanced pre-processing and lexicon-building steps. Every country/part of a county has its own version or dialect of Arabic. That means there are differ-

ent dialects of Arabic text available online that could hold different meaning [3].

(3) The limitation of customized tools for Arabic SA may not be easy to come by. Available tools may be limited in current functionality or may not be freely available.

(4) Multiple words prefixes, suffixes, affixes, and diacritical forms add high-order dimensionality for words, where the same three-letter root can generate different words in each case.

(5) Arabic grammar is highly complex. Different types of sentence structures can exist in Arabic: verbal, where the sentence starts with a verb phrase, and nominal, where the sentence starts with a noun phrase. Additionally the language allows for different variants within each type of sentence [32].

(6) The presence of negation words can cause a sentence to have two opposite sentiments at the same time or toggle the polarity.

#### 5 CONCLUSION

From the study, comparison and analysis of the different proposed methodologies for SA it was observed that SVM yield the best performance in case of SA. The problem with NB is that it is based on probabilities, thus it is more suitable for inputs with high dimensionality. Because of the principal advantages of SVM, it was applied successfully in several sentiment analysis tasks. These principal advantages can be summarized as follows: They are robust in high dimensional spaces. All features are considered relevant. They are robust when there is a sparse set of samples. Finally, most text categorization problems are linearly separable [29].

This work highlighted important papers in Arabic Sentiment analysis. It also revealed many challenges and open areas that need to be addressed and investigated to enhance this field.

#### 6 FUTURE WORK

We can summarize the future work in Arabic SA as follows:

- Building a big corpus and putting it freely public.
- Using the big corpus to compare methodologies.
- Building larger lexicons and dictionaries
- More investigation for Arabic negation.
- Building appropriate Stemmer for Arabic dialects.
- More research in semantic analysis as the same word can have many meanings in different contexts.
