# Bending Analysis of Laminated Composite Plates Using Higher Order Theory Of 18 Degree Of Freedom Adopting Finite Element Approach 

R J Fernandes, Megha H Koppad

#### Abstract

Laminated composite plates(LCP) are extensively used to solve special problems in engineering applications so bending, dynamic and stability behaviors are important to the designers. The paper aims at bending analysis of these plates with higher order theory. The application of higherorder theory that accounts for the realistic variation of in-plane and transverse displacements through the thickness for the static response analysis of thick multi-layered composite plates shall be studied. Code is developed using MATLAB with finite element formulation for 18 degrees of freedom with good agreement.

Index Terms- Laminated composite plates, bending analysis, transverse displacement, higher order theory, finite element, degrees of freedom, MATLAB.

## 1 Introduction

COmposite plates are made by joining same or different material plates together in layers and laminated to fulfill the required properties. Laminated composite plates have unique properties than when compared to its constituent materials such as high stiffness to weight ratio, high strength to weight ratio, low maintenance, high corrosion resistance, durable, low specific weight, high specific strength and stiffness properties. Deformation of laminated plates is defined by coupling between bending and shear deformation.

## 2 Method

### 2.1 FEM

Finite element method is a mathematical method used to determine boundary value problems. In FEM the major element is divided into smaller ones called finite elements followed by solving them and then combining those to one major original initial problem. The division of an element is made by creating a mesh by joining certain number of nodes with each other in which that mesh constitutes the whole element. This project involves finite elements of mesh created by using nine nodes.

### 2.2 Displacement model

Based on the assumptions of displacement model, a higher order shear deformation theory (HSDT) is developed to analyze the stresses. The displacement model with EIGHTEEN degrees of freedom is in the following form:
The displacement model for unsymmetrical laminates, $\mathrm{u}(\mathrm{x}, \mathrm{y}, \mathrm{z})=u_{0}(\mathrm{x}, \mathrm{y})+\mathrm{z} \Theta_{\mathrm{x}}(\mathrm{x}, \mathrm{y})+\mathrm{z}^{2} \mathrm{u}_{0}{ }^{*}(\mathrm{x}, \mathrm{y})+\mathrm{z}^{3} \Theta_{\mathrm{x}}{ }^{*}(\mathrm{x}, \mathrm{y})+\mathrm{z}^{4}{u_{0}}^{* *}(\mathrm{x}, \mathrm{y})+\mathrm{z}^{5} \Theta_{\mathrm{x}}{ }^{* *}(\mathrm{x}, \mathrm{y})$
$\mathrm{v}(\mathrm{x}, \mathrm{y}, \mathrm{z})=\mathrm{V}_{0}(\mathrm{x}, \mathrm{y})+\mathrm{z} \Theta_{\mathrm{y}}(\mathrm{x}, \mathrm{y})+\mathrm{z}^{2} \mathrm{~V}_{0}{ }^{*}(\mathrm{x}, \mathrm{y})+\mathrm{z}^{3} \Theta_{\mathrm{y}}{ }^{*}(\mathrm{x}, \mathrm{y})+\mathrm{z}^{4} \mathrm{~V}_{0}{ }^{* *}(\mathrm{x}, \mathrm{y})+\mathrm{z}^{5} \Theta_{\mathrm{y}}{ }^{* *}(\mathrm{x}, \mathrm{y})$
$\mathrm{w}(\mathrm{x}, \mathrm{y}, \mathrm{z})=w_{0}(\mathrm{x}, \mathrm{y})+\mathrm{z} \Theta_{\mathrm{z}}(\mathrm{x}, \mathrm{y})+\mathrm{z}^{2} w_{0}{ }^{*}(\mathrm{x}, \mathrm{y})+\mathrm{z}^{3} \Theta_{\mathrm{z}}{ }^{*}(\mathrm{x}, \mathrm{y})+\mathrm{z}^{4} \mathrm{w}_{0}{ }^{* *}(\mathrm{x}, \mathrm{y})$
$\left\{\begin{array}{l}\epsilon_{1} \\ \epsilon_{2} \\ \epsilon_{3} \\ \gamma_{12} \\ \gamma_{23} \\ \gamma_{13}\end{array}\right\}=\left[\begin{array}{cccccc}1 / E_{1} & -\gamma_{21} / E_{2} & \gamma_{31} / E_{2} & 0 & 0 & 0 \\ 1 / E_{22} & -\gamma_{32} / E_{3} & -\gamma_{12} / E_{2} & 0 & 0 & 0 \\ 1 / E_{3} & -\gamma_{13} / E_{1} & -\gamma_{23} / E_{2} & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 / G_{12} & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 / G_{23} & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 / G_{13}\end{array}\right]\left\{\begin{array}{c}\sigma_{1} \\ \sigma_{2} \\ \sigma_{3} \\ \tau_{12} \\ \tau_{23} \\ \tau_{13}\end{array}\right\}$

The strain corresponding to displacement model can be written as,

$$
\begin{aligned}
& \epsilon_{x}=\epsilon_{x 0}+z k_{x}+z^{2} \Theta_{x 0}{ }^{*}+z^{3} k_{x}{ }^{*}+z^{4} \Theta_{x 0}{ }^{* *}+z^{5} k_{x}^{* *} \\
& \epsilon_{y}=\Theta_{y 0}+z k_{y}+z^{2} \Theta_{y 0}{ }^{*}+z^{3} k_{y}{ }^{*}+z^{4} \Theta_{y 0}{ }^{* *}+z^{5} k_{y}^{* *} \\
& \epsilon_{z}=\Theta_{z 0}+z k_{z}{ }^{*}+z^{2} \Theta_{z 0}{ }^{*}+z^{3} k_{z}^{* *}+z^{4} \Theta_{z 0}{ }^{* *} \\
& \gamma_{x y}=\Theta_{x y o}+z k_{x y}+z^{2} \Theta_{x y 0_{0}}{ }^{*}+z^{3} k_{x y}{ }^{*}+z^{4} \Theta_{x y o}{ }^{* *}+z^{5} k_{x y}{ }^{* *} \\
& \gamma_{y z}=\phi_{y}+z k_{y z}+z^{2} \oint_{y}{ }^{*}+z^{3} k_{y z}{ }^{*}+z^{4} \phi_{y}{ }^{* *}+z^{5} k_{y z}{ }^{* *} \\
& \gamma_{x z}=\oint_{x}+z k_{x z}+z^{2} \oint_{x}{ }^{*}+z^{3} k_{x z}{ }^{*}+z^{4} \oint_{x}^{* *}+z^{5} k_{x z}{ }^{* *}
\end{aligned}
$$

1. $\mathrm{N}_{\mathrm{l}}=\frac{1}{4}\left(\xi^{2}-\xi\right)\left(\boldsymbol{\eta}^{2}-\boldsymbol{\eta}\right)$
2. $\mathrm{N}_{2}=\frac{1}{4}\left(\xi^{2}+\xi\right)\left(\boldsymbol{\eta}^{2}-\boldsymbol{\eta}\right)$
3. $\mathrm{N}_{3}=\frac{1}{4}\left(\xi^{2}+\xi\right)\left(\boldsymbol{\eta}^{2}+\boldsymbol{\eta}\right)$
4. $\mathrm{N}_{4}=\frac{1}{4}\left(\xi^{2}-\xi\right)\left(\boldsymbol{\eta}^{2}+\boldsymbol{\eta}\right)$
5. $\mathrm{N}_{5}=\frac{1}{4}\left(1-\xi^{2}\right)\left(\boldsymbol{\eta}^{2}-\eta\right)$
6. $\mathrm{N}_{6}=\frac{1}{4}\left(\xi^{2}+\xi\right)\left(1-\eta^{2}\right)$
7. $\mathrm{N}_{7}=\frac{1}{4}\left(1-\xi^{2}\right)\left(\eta^{2}-\eta\right)$
8. $N_{8}=\frac{1}{4}\left(\xi^{2}-\xi\right)\left(1-\eta^{2}\right)$
9. $\mathrm{N} 9=\frac{1}{4}\left(1-\xi^{2}\right)\left(\eta^{2}-\eta\right)$
nents of stress resultant vector $\sigma^{-}$for the laminate with NL number of layers are defined as,

$$
\left[\begin{array}{cccccc}
N_{x} & N_{x}^{*} & N_{x}^{* *} & M_{x} & M_{x}^{*} & M_{x}^{* *} \\
N_{y}^{*} & N_{y}^{*} & N_{y}^{* *} & M_{y} & M_{y}^{*} & M_{y}^{* *} \\
N_{z} & N_{z}^{*} & N_{z}^{* *} & M_{z}^{*} & N_{z}^{* *} & 0 \\
N_{x y} & N_{x y}^{*} & N_{x y}^{* *} & M_{x y} & M_{x y}^{*} & M_{x y}^{* *}
\end{array}\right]=\sum_{L=1}^{N L} \int_{z L} z_{L+1}\left\{\begin{array}{c}

\end{array}\right\}\left(1 z^{2} z^{4} z z^{3} z^{5}\right) d z
$$

$Q_{x}=Q_{11} \epsilon_{\mathrm{x}}+\mathrm{Q}_{12} \mathrm{E}_{\mathrm{y}}+\mathrm{Q}_{13} \mathrm{E}_{2}+\mathrm{Q}_{14} \mathrm{Y}_{\mathrm{xy}}$
$\mathrm{Q}_{4}=\mathrm{Q}_{12} \mathrm{E}_{\mathrm{x}}+\mathrm{Q}_{22} \mathrm{C}_{\mathrm{y}}+\mathrm{Q}_{23} \mathrm{E}_{2}+\mathrm{Q}_{24} \mathrm{Y}_{\mathrm{xy}}$
$g_{b}=Q_{13} \mathrm{E}_{\mathrm{x}}+\mathrm{Q}_{32} \mathrm{E}_{\mathrm{y}}+\mathrm{Q}_{33} \mathrm{E}_{2}+\mathrm{Q}_{34} \mathrm{Y}_{\mathrm{xy}}$
$\tau_{\text {sxk }}=Q_{14} \mathrm{E}_{\mathrm{x}}+\mathrm{Q}_{42} \mathrm{E}_{\mathrm{y}}+\mathrm{Q}_{43} \mathrm{E}_{2}+\mathrm{Q}_{44} \mathrm{X}_{\mathrm{xy}}$
$\mathrm{Y}_{\mathrm{xy}}=\mathrm{\epsilon}_{\mathrm{xys}}+\mathrm{kkxx}+z^{2} \mathrm{E}_{\mathrm{xyo}}{ }^{*}+z^{3} \mathrm{kxy}^{*}+z^{4} \mathrm{\epsilon}_{\mathrm{xyo}}{ }^{* *}+z^{3} \mathrm{kxy}^{* *}$

$\mathrm{H}_{\mathrm{i}}=\frac{1}{i}\left(z_{L+1}^{i}-z_{L}^{i}\right)$

### 2.3 Load Condition

The condition considered for this project is Sinusoidal load with SS2 boundary condition where,
along $x$-axis, at $y=0$ and $y=b$
$\mathrm{V}_{\mathrm{o}}=\mathrm{W}_{\mathrm{o}}=\mathrm{V}_{\mathrm{o}}{ }^{*}=\mathrm{V}_{0}{ }^{* *}=\mathrm{W}_{\mathrm{o}}{ }^{*}=\mathrm{W}_{\mathrm{o}}{ }^{* *}=\frac{\partial \mathrm{wo}}{\partial \mathrm{x}}=0$
along y -axis, at $\mathrm{x}=0$ and $\mathrm{x}=\mathrm{a}$
$\mathrm{u}_{\mathrm{o}}=\mathrm{w}_{\mathrm{o}}=\mathrm{u}_{0}{ }^{*}=\mathrm{u}_{0}{ }^{* *}=\mathrm{w}_{\mathrm{o}}{ }^{*}=\mathrm{w}_{\mathrm{o}}{ }^{* *}=\frac{\partial \mathrm{wo}}{\partial \mathrm{y}}=0$
The deflection, internal stress resultants and stresses which are non-dimensional are obtained by multiplying the below mentioned constants,

$$
m_{1}=\frac{10 E_{2} \hbar^{3}}{q a^{4}} ; m_{2}=\frac{1}{q a^{2}} ; m_{a}=\frac{1}{q a}
$$

## 3 RESULT

The results are obtained for different problem conditions for different number of layers using MATLAB for different parameters. Load used was sinusoidal SS2 condition for square cross-ply with 2 layers $\left(0^{\circ} / 90^{\circ}\right)$, 3 layers $\left(0^{\circ} / 90^{\circ} / 0^{\circ}\right)$, 4 layers $\left(0^{\circ} / 90^{\circ} / 90^{\circ} / 0^{\circ}\right)$ and angle-ply with 4 layers $\left(0^{\circ} / 45^{\circ} /-45^{\circ} / 90^{\circ}\right)$ which is simply supported.
The results from published articles were compared. The scholarly articles of Pagano and Matsunga were compared with present results with same condition as mentioned from respective papers are mentioned in Table 1 for displacement (W). The results for problems with different $\mathrm{a} / \mathrm{h}$ and E are mentioned in Table 2 and 3 for displacement (W), stresses ( $\sigma_{x}, \sigma_{y}$, $\tau_{\mathrm{xy}}$ ). The numerical problems and results are as follows:
3.1 Problem 1: $\mathrm{E}_{1} / \mathrm{E}_{2}=25 ; \mathrm{G}_{12}=\mathrm{G}_{13}=0.5 ; \mathrm{E}_{2}=\mathrm{E}_{3}=1 ; \mu_{12}=\mu_{13}$ $=0.25$; cross-ply; SS2 condition

## 4 CONCLUSION

The results show that the values are close to exact result values mentioned in articles of Pagano and Matsunga for problem 1 for displacement (W). Outcomes prove that the finite element method of higher order shear deformation theory can be effectively applied for laminated composite plates. The graph plotted for problem 1 and problem 2 outcomes respectively shows that the displacement (W) \& $\tau_{\mathrm{xy}}$ in both cases keeps on noticeably decreasing with increase in $a / h$ ratio. The graph plotted for problem 1 and problem 2 outcomes shows that the stresses $\sigma_{\mathrm{x}}$ and $\sigma_{\mathrm{y}}$ in both cases keeps on increasing as $\mathrm{a} / \mathrm{h}$ ratio increases. The results of problem 3 shows that $\sigma_{\mathrm{x}}$ and $\sigma_{y}$ are almost similarly increasing while $\tau_{x y}$ and displacement (W) keeps on decreasing with increase in $\mathrm{a} / \mathrm{h}$ ratio. On inte-
grating equilibrium equations of elasticity over lamina thickness, the transverse stresses can be obtained.
