Abstract:-Gene expression is the ability of a gene to express itself. It is controlled by different biological and physical factors. Physical factors-speed, distance and time (condition applied).Biological factors-regulatory proteins and hormonal control.

Term:- Motion within motion, Free Energy, Gravity Stress

INTRODUCTION-

DNA is hereditary material present in condensed form for two purposes.

- A) For proper packaging in nucleus. (Condition applied)
- B) For proper gene expression.
- C) Now question arises what will be the consequences if DNA will not occur in condensed form?
 - a) Improper packaging of DNA.
 - b) Unusual gene expression Leads to variations (condition applied)
- c) Unusual gene expression-During evolution some genes are hide by our body system in order to adapt our self according to environment. These genes play major role in maintenance of ecological balance. One of which is ageing genes. These genes start expressing themselves after certain time generally after the age of 30 and ultimately lead to death. Here two questions arise?
 - d) Did our body Imposing we have to die or nature ?
 - e) I am neglecting the first Opinion that our body is imposing that we have to die. Because there are no specific genes which Intentionally made for causing ageing. So it is nature. My answer is yes . What again question arises how?
 - f) Time and distance- How nature is effecting ageing time of every Organism ? Which format nature is using for calculating time? Answer is distance. We are traveling million of distance with the variable speed of lakes of kilometer/hour when observed from different point of reference (condition applied). Again question arises, how distance and speed leads to variation in gene expression? This answer is given by the experiment performed.

2) EXPERIMENT:-

(Motion within motion with variable speed) A thread wrapped on iron coil placed in an electronic vehicle moving with the speed of 4km/h this electronic vehicle placed inside a revolving disc with the speed of 20km/hour for the time period of 48 hours result were shocking.

Assumption-

- a) Assume iron coil as histone proteins and thread as DNA (conditions applied)

Observation- Loosening of thread with uncoiling is taking place.

- b) Predictive result- Ageing is because of distance traveled by us which leads to uncoiling of DNA. In logical way it is explained as follows.

Acc. to Gibbs free energy equation things will be spontaneous if we are supplying energy to them from outside. Now question arises that DNA uncoiling is basically due to higher energy states of atoms and leads to distortion. Further question arises is body have any mechanism to prevent this effect? Answer is yes. Body prevents the uncoiling by promotion further condensation of DNA in exaggerated manner, leads to low gene expression of enzymes required in our body metabolism. (Condition applied)

B) Supporting evidences from nature.

- a) Variation of flora and fauna at poles and equator in term of life span.
- b) Low lifespan of pilots retired in late 65 years age (conditions applied)
- c) Theory of time traveling (conditions applied)
- d) If above and observation is not biased, then whole universe will have two types of living beings if compared from two edges of Universe and I had concluded two theories.

3) THEORY OF VARIATION OF GENE EXPRESSION WITH DIFFERENT MODULES-

- a) Movement of galaxy- Major impact on gene expression.
- b) Movement of stars- Large impact.
- c) Movement of earth- Powerful impact.
- d) Movement about the axis - Minor impact.

If above observation is not biased then extraterrestrial life from our galaxy will be almost 35% similar to us. Large variation will occur if we will face life from other galaxies.

4) THEORY OF EXISTENCE OF SUPREME ORGANISMS-

A) LIFE TOWARDS THE ORIGIN OF UNIVERSE- At the point of origin of universe large stars will be there with large planet size if we will observe whole universe the inner core will appear to be stable like atomic nuclei, Outer side will have great movement like electrons and positrons.

Effect of this planetary structure on organisms will be as follows

a) Enormously large sized organisms, due to high gravity stress (condition applied) large size of brain capable of generating powerful electromagnetic rays if we will be nearer to them we will not survive. These rays even can control us and can imitate different structures in other words they can make us the feeling of their presence and even modify our dreams. This is bigger question that they are always sending different messages to us in the visual or auditory form but our senses are not able to detect them. There ageing process will be very slow there single day will be equivalent to our complete life span it is quite funny and interesting.

b) Format of Science used by them- Radiation science, Telepathy and engineering drawing. They will be poor in medical fields and electronics as they can heal and communicate with their brain.

B) LIFE TOWARDS THE ENDING EDGE OF UNIVERSE- At the ending edge of universe there will be smaller planets and smaller organisms with small brain size. They will possess negligible life span as compare to supreme organisms.

a) Format of Science used by them- They will be well develop in electronics and electrical engineering, better good in medical science, and other pleasure providing instruments.

b) It is clear from above if we have to search new technology then we have to search extraterrestrial life towards the ending edge of universe. But question arise how we will decide which is the end of or centre of universe?

c) Towards the centre of Universe we can move very easily but we will never come back due to high gravity planets. It will be suicide to move towards centre of universe. If we want to move towards outer side then we can easily move with normal spaceship (condition applied)

6) IMPROVEMENT REGARDING THE SCIENCE USED BY US-

A) We have to increase the limits of science even insects and dogs can use different formats of science, only we have to change way of observation.

B) Research areas for further research-

a) How we can amplify different signals from brain and observe them?

b) Further research in electromagnetic studies.

c) How we can develop a medicine which can stabilize our DNA and can enhance our life span?

7) **CONCLUSION-** From my point of view we all are weeds sown by a powerful farmer to make his field suitable for fertile crops. Now question arises when he will clean his field from existing weeds and will sow a good variety of a crop?
