Abstract :The organization of physical space is considered here from physical, metaphysical and philosophical points of view. Relevant thoughts reveal the model of an operator which operates physically in physical space. Accordingly, it generates and degenerates (if any at all) the material universe.

Key words : Spider-webs, cognition, organizing operator.

Introduction : This paper is in continuation to my earlier two papers in physics, Physical Space And Its Dimensions (IJSER volume 3 issue 8 August 2012) and Physical Space And Its Nature (IJSER volume 3 issue 10 October 2012). According to modern physicists, the universe is like mutually related mobile spider-webs. However, physical space (including its singularities) may have confident relationship to any prime cognition, so far as organization of physical space is concerned. Consequent upon the foregoing thoughts, an attempt is made to propose a model of the action of an organizing operator in physical space, that may even enunciate unifications of physics.

Discussion : One stream of metaphysics is to meditate on the marching speed of the cosmic sound. It has passed through the physical space to the subtle shining veins of rays that hold all matter in manifestation. Eternity of physical space yawns at us below, above, on the left and on the right, in front and below, within and without. [1]

Furthermore, some systems of philosophy are fundamentally mystic. Such systems frequently aim beyond logic. It is well known that according to such a system of Indian philosophy propounded by Kanada, some entity excellence is agreed to.

Let us consider all these ideas to arrive at the conclusion.

Conclusion : In psychology, the state of not knowing had to be agreed to. Because, some mental events cannot be properly explained without any hypothesis originating from the state of not knowing. [2]

It is well known that Prof. W. Durant said, “ Mind and matter are equally, relative phenomena.”

The organizer of physical space may be considered as spaceless and beyond all matter. Considering events of changes and related disciplines, certainties and uncertainties in nature and also equations and inequations of nature, a model is proposed that an organizing operator, operating on energy field(s) in physical space, generates and degenerates (if any at all) the material universe. This model may enlighten organization of physical space at root.
