# Synthesisof Some Fused Heterocyclic Compounds Based on 1-(1-Benzofuran-2-yl)-3-(furan-2-yl)prop-2-en-1-one 

${ }^{(a)}$ Azza M. Abdel-Fattah, ${ }^{(b)}$ Fawzy A. Attaby and ${ }^{(c)}$ Labeeb M. Shaif

#### Abstract

Benzofuran-2-yl)-3-(furan-2-yl)prop-2-en-1-one(3)reacted with 2-cyanoethanethioamide (4)to afford the corresponding 6-(1-benzofuran-2-yl)-4-(furan-2-yl)-2-thioxo-1,2-dihydropyridine-3-carbonitrile(5). The synthetic potentiality of compound 5 was investigated in the present study via its reactions with several active-hydrogen containing compoundsaiming to synthesize each of thieno[2,3-b]pyridine derivatives $\mathbf{8 a}, \mathbf{b}, \mathbf{1 1}, \mathbf{1 4 a}, \mathbf{b}, \mathbf{1 7}, \mathbf{2 0 , 2 3} ; \mathbf{3 -}$ aminothieno[2,3-b]pyridine-2-carbohydrazidederivative 24 which used in turn, to prepare( 1 H -pyrazol-1-yl)carbonyl-thieno $[2,3$-b]pyridin-3-amine $26, \mathrm{~N}$ -phenylmethylenethieno[2,3-b]pyridine-2-carbohydrazide31, pyrido[3', $\left.2^{\prime}: 4,5\right]$ thieno[3,2-d]pyrimidinone derivatives 33, 35, 38a,b andpyrazolo[ $\left.3^{\prime}, 4: 4,5\right]$ thieno[ 2,3 -b]pyridine-3-one derivative 40 . The structures of the newly synthesized heterocyclic compounds were elucidated by considering the data of both elemental and spectral data.

Index Terms:2-Cyanoethanethioamide; Pyridothienopyrimidinones;N-phenylmethylenethienopyridin-2-carbohydrazides; 2-Thioxopyridine-3-carbonitrile.

## 1 INTRODUCTION

$\mathbf{T}_{\text {hieno[2,3-b]pyridines are of special importance due to }}$ the reported biological activities, such as antimicrobial ${ }^{1-4}$, potent antitumor ${ }^{5}$, antifungal agents ${ }^{6}$ and antiinflammatory ${ }^{7}$ activities. Enaminoester moieties were utilized in synthesis of different heterocyclic systems with pronounced biological and pharmaceutical activities such as thienopyrimidines ${ }^{8}$.Additionally, derivatives of thieno-[3,2-d]pyrimidines are of interest as biologically active compounds 9,10 .In light of all these considerations and in continuation of our long-term interest in the chemistry of pyridines ${ }^{11-17}$ we wish to report herein on the scope of 2-thioxopyridine-3-carbonitrile for their hetero-cyclization with some $\alpha$-halocarbonyl containing reagents. The work has resulted in the formation of several new functionally substituted pyridines which could also, be annulated into fused heterocyclic ring systems.

## 2 RESULTS AND DISCUSSION

It has been found that 1-(1-benzofuran-2-yl)ethanone ${ }^{18}(\mathbf{1})$ reacted with furan-2-carbaldehyde(2) in 1:1molar ratio to give the corresponding 1-(1-benzofuran-2-yl)-3-(furan-2-yl)prop-2-en-1-one(3)whichreacted under reflux with 2cyanoethanethioamide (4)in absolute ethanol containing a catalytic amount of piperidine to afford a reaction product 5. Such reaction product was formed via a Michael addition of $-\mathrm{CH}_{2}$ - in $\mathbf{4}$ on- $\mathrm{CH}=\mathrm{CH}$ - of $\mathbf{3}$ followed by cyclization via dehydration and dehydrogenation to give 5. Considering the data of $\operatorname{IR},{ }^{1} \mathrm{H}$ NMR, Mass spectrometry and elemental

(c) Ibb University, Faculty of Science, Yemen.
analyses (cf. Exp. Part) the structure of 5 was investigated. The synthetic potentiality of 5 was investigated through its reaction with several active-halogen containing compounds e.g. chloroacetamide, 2 -chloro-N-(4-bromophenyl)acetamide ( $\mathbf{6 a}, \mathbf{b}$ ). Thus, it has been found that compound $\mathbf{5}$ reacted with chloroacetamide (6a) in 1:1 ratio in methanolic sodium under reflux to afford firstly 2-\{6-(1-benzofuran-2-yl)-3-cyano-4-(furan-2- yl)pyridine-2-ylfacetamide 7awhich formed through dehydrochlorination. The IR spectrum of 7a showedthe presence of absorption bands corresponding to the $\mathrm{CONH}_{2}$ and $\mathrm{CNfunctions}$. the parent peak at $\mathrm{m} / \mathrm{z}=375$ which corresponding to its molecular weight, the base peak at $\mathrm{m} / \mathrm{z}=331$ which corresponds to the fragment of $\mathrm{M}^{+}-\mathrm{CONH}_{2}$ and peak at $\mathrm{m} / \mathrm{z}=306$ which corresponds to the fragment of $\mathrm{M}^{+}$-furyl, 2 H . The formation of compound 7 a was further elucidated via its cyclization in ethanolic potassium hydroxide solution to afford the corresponding thieno[2,3-b]pyridine derivative 8a. In a similar manner,2-chloro N -(4bromophenyl)acetamide ( $\mathbf{6 b}$ ) was reacted with compound 5to afford the corresponding $2-\{6$-(1-benzofuran- 2 -yl)-3-cyano-4-(furan-2-yl)pyridine-2-yl\}-N-(4-bromophenyl)acetamide $\mathbf{7 b}$ which in turn, cyclized in ethanolic potassium hydroxide solution to afford the corresponding thieno[2,3blpyridine derivative $\mathbf{8 b}$. The ${ }^{1} \mathrm{H}$ NMR spectrum of compound $\mathbf{7 b}$ revealed the signals of $\mathrm{CH}_{2}$ at $4.18 \mathrm{ppm}, \mathrm{NH}$ at 10.61 ppm in addition to aromatic, furan and pyridine protons and the mass spectrum of $\mathbf{8 b g a v e}$ the parent peak $\left(\mathrm{M}^{+}\right)$at $\mathrm{m} / \mathrm{z}=530$ as well as the isotope peak $\left(\mathrm{M}^{+}+2\right)$ at $\mathrm{m} / \mathrm{z}=532$ and peak at $\mathrm{m} / \mathrm{z}=359$ which corresponding to the fragment of $\mathrm{M}^{+}-\mathrm{NHC}_{6} \mathrm{H}_{4}-4-\mathrm{Br}$ (cf. Exp. Part).Likewise, it has been found that compound 5 reacted with 1chloroacetone $(9$ a) under the same above mentioned experimental conditions to afford 6-(1-benzofuran-2-yl)-4-(furan-2-yl)-2-[(2-oxoprop-yl)sulfanyl]pyridine-3-carbonitrile (10a). The IR $\left(\mathrm{cm}^{-1}\right)$ of this compound showed the
absorption bands corresponding CO and CN functions as well as its ${ }^{1} \mathrm{H}$ NMR revealed the signals of $\mathrm{COCH}_{3}, \mathrm{SCH}_{2}$, furan, aromatic and pyridine protons (cf. Exp. Part and Scheme 1). Compound 10a cyclized in ethanolic potassium hydroxide under reflux 5 hr to afford the corresponding thieno[2,3-b]pyridine derivative 11 whose structure was established by considering the data of IR, ${ }^{1} \mathrm{H}$ NMR and elemental analyses,moreover, its mass spectrum showed
the peaks according to the fragmentation pattern illustrated below.An authentic sample of compound 11 obtained through the reaction of compound 5 with 3-chloropentane-2,4-dione ( $\mathbf{9 b}$ ) under the same experimental conditions. It is important to report here that all trials to isolate the intermediate 10b were failed under a variety of experimental conditions (cf. Exp. Part and Scheme 1).

## Fragmentation pattern of compound 10a:

Similarly, Compound 5 was reacted with each of 2-bromo-1-(phenyl or 4-chlorophenyl)ethanone (12a,b) and chloromethylbenzimidazole (15) to afford 6-(1-benzofuran-2- yl)-2-\{2-phenyl or 4-chlorophenyl-2-oxoethyl] or $2-[(1 \mathrm{H}-$ benzimidazol-2-ylmethyl)sulfanyl\}-4-(furan-2-yl)-pyridine3 -carbonitriles 13a,b and $\mathbf{1 6}$ respectively. Compounds $\mathbf{1 3 a}, \mathbf{b}$
and 16 were cyclized in respective manner to afford $\mathbf{1 4 a , b}$ and 17 in ethanolic potassium hydroxide under reflux 5 hr . The IR ( $\mathrm{cm}^{-1}$ ) of compounds $13 \mathrm{a}, \mathrm{b}$ and 16 showed the absorption bands of CN functions which disappeared from the IR $\left(\mathrm{cm}^{-1}\right)$ of compounds $14 \mathrm{a}, \mathrm{b}$ and 17 in addition to the absorption bands of $\mathrm{NH}_{2}$ group for compounds $\mathbf{1 4 a}, \mathbf{b}$ and
17. Moreover, we elucidated the structures of each of compounds $13 \mathrm{a}, \mathrm{b}, \mathbf{1 6}, \mathbf{1 4 a , b}$ and 17 by considering the data of ${ }^{1} \mathrm{H}$ NMR, mass spectra as well as that of elemental analyses(cf. Exp. Part and Scheme 2).The study was extended to explore the nucleophilic reactivity of SH group in compound 5 towards electrophilic C-containing reagents e.g. iodomethane and chloroacetonitrile 18a,b. Thus, it has been found that compound 5 was reacted with iodomethane (18a) in methanolic sodium methoxide under stirring at room temperature for 30 min . to give the corresponding 2-methylthio derivative 19a whose structure was elucidated by considering the data of elemental analyses, IR and mass spectra (cf. Exp. Part). Also, compound 20 obtained without isolation of 19b under a
variety of reaction conditions through the reaction of compound 5 with chloroacetonitrile ( $\mathbf{( 1 8 b}$ ) in methanolic sodium methoxide either at room temperature under stirring or under reflux for $3-5 h r$. The $\operatorname{IR}\left(\mathrm{cm}^{-1}\right)$ of this reaction product showed the absorption bands of CN and $\mathrm{NH}_{2}$ functions andits mass spectrum gaveparent and base peak at $\mathrm{m} / \mathrm{z}=357$ which corresponds to its molecular weight. Furthermore, peaks at $\mathrm{m} / \mathrm{z}=356,355,341$ and 331 which corresponds to the fragments related to the removal of $\mathrm{H}, 2 \mathrm{H}, \mathrm{NH}_{2}$ and CN radicals from radical-cation $\left(\mathrm{M}^{+}\right.$.) form of compound 20 . The ${ }^{1} \mathrm{H}$ NMR spectrum of this reaction product revealed the signals of $\mathrm{NH}_{2}$, furan, pyridine and aromatic protons (cf. Scheme 3 and Exp. Part).

8a,b

Scheme 1
Scheme 1: Synthesis of 7a,b; 8a,b; 10a and $\mathbf{1 1}$ from pyridinethione derivative 5

Scheme 2: Synthesis of 13a,b; 14a,b; 16; 17 from pyridinethione derivative 5

Compound 5 was reacted with methyl chloroacetate (21) underthe same above-mentioned experimental conditions to afford the reaction product 22 which cyclized to the corresponding thieno[2,3-b]pyridine derivative 23. The structure of both 22 and 23 was elucidated by considering the data of elemental analyses and spectral data studies (cf. Exp. Part and Scheme 3). Compound 23 was used as a good starting material to synthesize new synthon 24 through its reaction with hydrazine hydrate. The $\operatorname{IR}\left(\mathrm{cm}^{-1}\right)$ of compound 24 showed the absorption bands of $\mathrm{NH}_{2}$ and $\mathrm{NHNH}_{2}$ as well as its ${ }^{1} \mathrm{H}$ NMR spectrum revealed the signals of $\mathrm{NH}_{2}, \mathrm{NHNH}_{2}$, furan, pyridine and aromatic protons. Moreover, its mass spectrum gave the parent peak $\left(\mathrm{M}^{+}\right)$at $\mathrm{m} / \mathrm{z}=390$ which corresponds to its molecular weight and peaks corresponds to the fragments at $\mathrm{M}^{+}-\mathrm{H}, \mathrm{M}^{+}-\mathrm{NH}_{2}$, $\mathrm{M}^{+}-\mathrm{NHNH}_{2}, \mathrm{M}^{+}-\mathrm{CONHNH}_{2}$ (cf. Exp. Part and Scheme 3).
The chemical reactivity and synthetic potentiality of 24 was investigated via its chemical reactions with several reagents. Thus, it has been found that 24 was reacted with each of pentan-2,4-dione 25andethyl 3-oxobutanoate27in acetic acid under reflux for 3-5 hours to afford the reaction products26 and 28. ${ }^{1} \mathrm{HNMR}$ spectrum of 26 was found in good agreement with the assigned structure. Compound

24was reacted with (benzylidene)malononitrile (29) or benzaldehyde (30) in pyridine-ethanol mixture under reflux to afford the reaction product formulated as 31 (cf. Scheme 4). The chemical structure of 31 was confirmed by considering the data of IR and elemental analyses. Moreover, its mass spectrum gave $\mathrm{m} / \mathrm{z}=478$ (38.2 \%) which corresponding to its molecular weight, in addition to several peaks corresponding to fragments that confirm its structure. Also ${ }^{1} \mathrm{HNMR}$ spectrum of 31was found in good agreement with the assigned structure (cf. Exp. Part and Scheme 4).
Compound 24 also, was reacted with each of formic acid, acetic anhydride, triethyl orthoformate, dimethylform-amide-dimethylacetal and glacial acetic acid in a respective manner to afford the corresponding pyridothienopyrimidines 33, 35, 38a, $\mathbf{b}$ andpyrazolo $\left[3^{\prime}, 4^{\prime}: 4,5\right]$ thieno[2,3$b$ ]pyridin-3-one 40 respectively. The elemental analyses and IR spectral data considered to elucidate the structure of these products and their mass spectra confirm their structures further, it gave $\mathrm{m} / \mathrm{z}=400$ (66.7 \%) for 33, 498(51.2\%) for 35, 456(16.5\%) for 38a, 455(14.6\%) for 38b and 415(36.8\%) for 40 (cf. Scheme 4).

## Synthesis of 5

A solution of each of $3(2.38 \mathrm{~g}, 10 \mathrm{mmol})$ and $4(1 \mathrm{~g}, 10 \mathrm{mmol})$ in absolute ethanol $(30 \mathrm{~mL})$ and few drops of piperidine was added and heated under reflux for 5 hrs . The reaction mixture was then evaporated till $1 / 3$ volume then leave the solution about thirty minutes, the product so formed, was collected by filtration, washed with cold ethanol, and then crystallized from the dioxane to give the corresponding 5.
